(NO:2024.05)

NVF7 Series Drive

Operation Instructions

Standard: EN/IEC 61800-3 EN/IEC 61800-5-1 Thank you for choosing NVF7 Series Drive.

The NVF7 Series Drive adopts speed sensorless vector control technology, which is characterized by fast load response, large low-frequency torque and strong overload ability, and realizes accurate control of equipment. This series drive has the application functions of regulated -voltage output, torque limitation, speed tracking, simple PLC, process PID, etc., and can meet the electric drive requirements of wire drawing, textile, machine tools, paper making, packaging, food, plastics, fans and pumps, and various automatic production equipment.

NVF7 Series Drive has standard RS485 communication protocol, which can meet the complex control and system integration requirements on site.

The NVF7 Series Drive fully considers the harmonic interference, dust and oil pollution of the industrial field power grid. The product has built-in anti-harmonic interference circuits, which can well suppress harmonic interference. Its modular structural design can reduce the dust and oil pollution from entering the machine, which can meet the complex environmental requirements on site.

NVF7 Series Drive is easy to operate and rich in functions, which is convenient for beginners to use and can also meet the complex application requirements of professional drive debuggers.

This manual introduces the functional characteristics and usage of NVF7 Series Drive, including product selection, installation and debugging, parameters and functions, etc. Please read the operation instructions carefully before using the drive to ensure the correct use of the drive. After reading and using the operation instructions, please keep it properly for future use.

If you encounter any difficulties or problems that cannot be solved during the use, please contact our local distributors or directly contact our professional technical personnel for help. (400 customer service hotline: 400-8177-777)

Our company reserves the right to continuously optimize and improve NVF7 Series Drive, and the information is subject to change without prior notice.

Safety Precautions

- 1 Please read the operation instructions carefully and follow all safety precautions herein before handling, installation, operation and maintenance. If it is ignored, it may cause personal injury or equipment damage, or even death.
- (2) We will not be responsible for injuries and equipment damage caused by the failure of your company or your customers to observe the safety precautions in the operation instructions.
- Safety Definition

| Identification | Notes | |
|----------------|--|--|
|) Danger | Where death or serious injury may be caused due to failure to operate as required. | |
| Note | Where moderate injury or minor injury may be caused, or property damage may be caused due to the failure to operate as required. | |

Before Installation

| Danger | If the drive is damaged or with incomplete components, please do not install and run it, otherwise it may cause fire and injury! Do not touch the main circuit terminal, control circuit terminal, electronic components and drive components directly with your hands! | |
|--------|--|--|
| Note | Please check whether the nameplate information of the product is consistent with your order requirements. If not, please do not install it! Please do not install the product when it is not consistent with the packing list! | |

Installation

| <u>A</u> Danger | Installation must be carried out by qualified personnel, otherwise it may cause electric shock! Please install the drive on nonflammable objects such as metal, otherwise it may cause fire! Do not put flammable objects nearby, otherwise it may cause fire! Do not install it in an environment containing explosive gas, otherwise it may cause explosion! Do not install it in direct sunlight, or it may cause damage to the equipment! It is strictly prohibited to install it in places where water droplets may splash, such as water pipes, otherwise it may cause damage to the equipment! |
|--------------------|--|
| Note | When handling, do not let the operation panel and cover plate be stressed, otherwise it may cause damage to the equipment and personal injury when falling! Please install it in a place that can bear the weight of the drive, otherwise it may cause damage to the equipment and personal injury when falling! During installation, it is strictly forbidden to leave wire ends or metal objects in the machine, otherwise it may cause fire! |

Distribution

| Danger | Wiring operation must be carried out by qualified personnel, otherwise it may cause electric shock! Make sure that the input power supply is completely disconnected before wiring operation, otherwise it may cause electric shock! The grounding terminal of the drive must be reliably grounded, otherwise it may cause electric shock! The exposed parts of the main circuit wiring cables must be wrapped with insulating tape, otherwise it may cause electric shock! Do not short-circuit and B, otherwise it may cause fire and damage to the equipment! The main circuit terminal and the wire terminal must be firmly connected, otherwise it may cause damage to the equipment! It is strictly forbidden to connect the terminals other than R1A, R1B, R1C, R2B and R2A in the control terminals to the AC 220V signal, otherwise it may cause damage to the equipment! |
|--------|--|
| Note | Before leaving the factory, all drives have been tested for withstand voltage. It is forbidden to test the drive for withstand voltage again, otherwise it may cause damage to the equipment! When the length of motor cable is more than 100 m, it is recommended to use multi-stranded wires and install AC output reactors that can suppress high-frequency oscillation. Avoid motor insulation damage, excessive leakage current and frequent protection of the drive! |

• Operation

| Danger | Cover the cover plate before powering on, otherwise it may cause electric shock and explosion! For drives that have been stored for more than 2 years, the voltage regulator shall be used to gradually boost the voltage when powering on, otherwise it may cause electric shock and explosion! Do not touch the terminal with your hands when the power is on, otherwise it may cause electric shock! Do not operate the drive with wet hands, otherwise it may cause electric shock! After replacing the control panel, be sure to set the parameters correctly before running, otherwise it may cause damage to the equipment! Non-professional technicians are forbidden to test signals during operation, otherwise it may cause electric. |
|--------------------|---|
| <u>∕</u> ∧ Note | Please confirm whether the phase number and rated voltage of the power supply are consistent with the nameplate of the product, otherwise it may cause damage to the equipment! Check the wiring of the main circuit of the drive to ensure that there is no short circuit and the wiring is fastened, otherwise it may cause damage to the equipment! The start and stop of the drive shall not be controlled frequently by switching it on and off, otherwise it may cause damage to the equipment! In civil environment, this product may cause radio interference, in which case, additional suppression measures (reactors, filters, etc.) may be required! |

Maintenance

|) Danger | Product maintenance, care, inspection or replacement of parts must be carried out by qualified personnel, otherwise it may cause electric shock! It is strictly forbidden to leave wire ends or metal objects in the machine, otherwise it may cause fire! It is forbidden to carry out maintenance, care, inspection or replacement of parts on the product with electricity, otherwise it may cause electric shock! Maintenance operation can only be carried out after the power supply is disconnected for 10 minutes and the voltage of positive and negative buses is lower than 36V, otherwise it may cause electric shock! |
|-------------|---|

Maintenance

| <u>∕</u> Note | During maintenance, care, inspection, or part replacement of the product, try not to touch the components, otherwise it may cause electrostatic damage to the components! All pluggable components must be plugged and unplugged under the condition of power failure! |
|------------------|---|
|------------------|---|

Motor And Mechanical Load

| Precautions | Notes | | |
|--|---|--|--|
| Comparison with power frequency operation | The output voltage is PWM wave, which contains certain harmonics. Therefore, the temperature rise, noise and vibration of the motor are slightly increased compared with power frequency operation. | | |
| Low-speed running | When the drive drives the ordinary motor to run at low speed for a long time, the output torque quota needs to be reduced because of the poor heat dissipation effect of the motor. If you need to run the drive at low speed and constant torque for a long time, be sure to select the drive motor. | | |
| Electronic thermal protection value of motor | When an adaptive motor is selected, the drive can provide thermal protection for the motor. If the rated capacity of the motor and the drive does not match, be sure to adjust the protection value or take other protection measures to ensure the safe operation of the motor. | | |
| Operation at a frequency above 50Hz | If it runs beyond 50Hz, besides considering the vibration and noise increase of the motor, the speed range of the motor bearing and mechanical device must also be ensured, and prior inquiry shall be ensured. | | |
| Lubrication of mechanical devices | Mechanical devices that need lubrication, such as gearbox and gears, may be damaged due to poor lubrication effect when running at low speed for a long time, so be sure to check them in advance. | | |
| Negative torque load | For occasions such as lifting the load, negative torque often occurs, and the drive often trips due to overcurrent or overvoltage faults, in which case, it shall be considered to select brake components with appropriate parameters. | | |
| Mechanical resonance point of load device | In a certain output frequency range, the drive may encounter the mechanical resonance point of the load device, which must be avoided by setting the jump frequency. | | |
| Frequent start-stop occasions | It is suitable for starting and stopping the drive through the terminal. It is forbidden to use contactors and other switching devices on the input side of the drive for direct and frequent start-stop operation, otherwise it will cause damage to the equipment. | | |
| Motor insulation inspection before connecting the drive | start-stop operation, otherwise it will cause damage to the equipment. Before the motor is used for the first time or used after being placed for a long time, the insulation of the motor shall be checked to prevent the drive from being damaged due to insulation failure of the motor winding. Wiring is as shown in the figure, please use 500V voltage megohmmeter when testing, and ensure that the measured insulation resistance less than 5MΩ. Motor cable terminals UW Motor Megger Grounding | | |

• Precautions For Use

| Precautions | Notes | | | |
|--|---|--|--|--|
| Capacitor or pressure sensitive device for improving power factor | Since the output of the drive is PWM wave, if the output side is equipped with a capacitor to improve the power factor or a varistor for lightning protection, it will trip the drive or damage the device, so please remove it. | | | |
| Use of switching devices such as contactors installed at the output terminals of the drive | If it is necessary to install switching devices such as contactors between the output of the drive and the motor, please ensure that the drive is switched on and off when there is no output, otherwise it may cause damage to the drive. | | | |
| Use beyond the rated voltage value | It is not suitable to use the drive outside the allowable operating voltage range. If required, please use the corresponding step-up or step-down device for voltage transformation. | | | |
| Lightning impulse protection | The drive is equipped with lightning protection device, which has certain self- protection ability for induction lightning. | | | |
| Altitude and derating | In areas with an altitude of more than 1000 m, derating use is required because of the poor heat dissipation effect of the drive caused by thin air. The relationship between the rated current of the drive and the altitude is shown in the figure. | | | |

• Scrapping Precautions

 Note
 The electrolytic capacitor on the main circuit and the electrolytic capacitor on the printed board may explode when burned!

 When plastic parts such as panels are burned, toxic gases will be generated!

 Please treat it as industrial waste!

1 Main purpose and scope of application

1.1 Unpacking check

After receiving the product, the following inspection shall be carried out. If there is any discrepancy, please contact your local dealer:

- Whether the external package of the drive is complete, and whether it is deformed, damaged, wet and damped, etc.;
- Open the package, please check the appearance of the drive to confirm whether there are scratches, rust, bumps, etc.;
- Please confirm whether the drive model is consistent with the product you ordered; Please confirm whether the product accessories are complete and consistent;
- If the model is inconsistent or the product has defects, do not install it. Please contact our agent distributor or our sales manager immediately.

1.2 Main purpose

The drive is mainly used for variable frequency speed regulation, torque control, enhancing operation accuracy, improving equipment power factor, overcurrent, overvoltage, overload protection and other functions of AC motor. At the same time, it can also save energy and reduce equipment noise.

1.3 Scope of application

NVF7 drive is suitable for two types of load: (1) constant torque and (2) variable torque.

2 Series product model and its meanings

2.1 Series product model machine and its meaning

The model on the product nameplate indicates the series and product specifications by the combination of letters and numbers, as shown in Figure 2.1.1.

3 Normal use conditions

3.1 Normal use environment

1) It shall be installed is indoors or inside the cabinet

2) Power supply overvoltage level III

3) Ambient temperature and relative humidity

Constant torque drive: -10°C \sim +40°C, derated between +40°C and +50°C, derated by 1% of rated power for every 1°C temperature rise.

The maximum relative humidity of air shall not exceed 90% (+20°C) and 50% (+40°C), and the change rate of relative humidity shall not exceed 5% per hour, and no condensation shall occur.

Dust-proof and waterproof grade Ip20

4) Environmental pollution below 2

5) Please install the drive in the following places:

In places without oil mist, corrosive gas, flammable gas and dust, foreign materials such as metal powder, oil and water shall not enter the drive. In places where there are no stinging substances and perishable materials, where there are no harmful gases and liquids, where there is little salt erosion and where there is no direct sunlight, do not install the drive on flammable materials such as wood.

6) Altitude

When rated output, the altitude of the installation and use place shall not exceed 1000m.

It shall be derated in areas with an altitude of more than 1000 m, and it shall be derated at a rate of 10% for every 1000m altitude increase. The highest altitude of the installation and use site shall not exceed 3000m.

7) Vibration resistance

5~8.5Hz, displacement 3.5mm; 8.5~200Hz, acceleration is not greater than 5.9m/s2.

3.2 Transportation and storage conditions

- 1) Please transport and store the product according to the transportation and storage conditions, and the storage temperature and humidity shall meet the requirements;
- Avoid transportation and storage in places prone to rain, direct sunlight, strong electric field, strong magnetic field and strong vibration;
- Avoid storing the product for more than 3 months. If the storage time is too long, please carry out strict protection and necessary inspection;
- Please pack the product and improve it before vehicle transportation. Closed boxes must be used for long-distance transportation;
- 5) It is strictly forbidden to transport this product together with articles that may affect or damage the product;
- Please use professional loading and unloading equipment to handle large-size or heavy-weight products;
- 7) When handling by hand, be sure to hold the product shell tightly to avoid the product parts falling off, otherwise it may cause injury;
- When handling the product, be sure to handle it with care, and pay attention to your step at any time to prevent tripping or falling;
- 9) When the equipment is hoisted by lifting tools, it is forbidden to stand and stay under the equipment.

3.3 Installation direction and installation space

In order to ensure the cooling effect of the product during working, please be sure to install it vertically.

Installation space and direction requirements

Figure 3.2.1 Installation Space of Single Machine

5 Structural characteristics and working principle

5.1 Characteristic diagram of product main circuit

The main circuit of NVF7 Series Drive includes rectifier bridge, precharge circuit, DC bus support capacitor, brake module, drive bridge and other devices and circuits. The topology diagram of the main circuit is shown below.

Figure 5.1.1 Schematic Diagram of Main circuit below NVF 7-15T/18.5P (Inclusive)

NVF7 Series Drive Operation Instructions

5.2 Product structure characteristic diagram

NVF7 has two types of material structure, the model of 22T/30P and below is of plastic shell structure, and the model of 30T/37P and above is of sheet metal structure. As shown in the figure below:

• The product outline, installation size and weight are summarized as follows:

Table 6.1.4 Product shape, installation dimensions and weight

6.2 Flange mounting bracket

There are 3 installation methods for NVF7 Series Drives, namely wall-mounted installation, flange installation and floor-mounted installation, among which T2-T11 support wall-mounted installation and T2-T10 flange installation.

| shell frame | Flange Kit No. |

6.3 floor-mounted base installation

T11 and above models support the floor-mounted base installation method. For details, please consult our agent distributor or regional sales manager.

6.4 Outline and installation dimensions of operation panel and mounting bracket

NVF7 Series Drive comes standard with detachable LED operation panel. The operation panel supports two external installation methods: First, the installation method without mounting bracket; Second, the installation method with mounting bracket. The outline and installation dimensions of the operation panel and mounting bracket are shown below.

NVF7 series inverters are equipped with a removable LED display box as standard. The display box supports external mounting, and the shape and mounting dimensions of the display box and pallet are shown below.

Figure 6.4.1 Overall Dimension of Operation panel

Figure 6.4.2 Installation Dimension of Cabinet Door of Operation panel (Installation with Mounting bracket)

7 Installation, debugging and operation

7.1 Inspection before installation

Installation environment

1) It shall be installed is indoors or inside the cabinet

2) Power supply overvoltage level III

3) Ambient temperature and relative humidity

Constant torque drive: -10°C \sim +40°C, derated between +40°C and +50°C, derated by 1% of rated power for every 1°C temperature rise.

The maximum relative humidity of air shall not exceed 90% (+20°C) and 50% (+40°C), and the change rate of relative humidity shall not exceed 5% per hour, and no condensation shall occur.

Dust-proof and waterproof grade Ip20

4) Environmental pollution below 2

5) Please install the drive in the following places:

In places where there is no oil mist, corrosive gas, flammable gas and dust, where there are no irritating substances and explosives, where there is little salt erosion, and where there is no direct sunlight, do not install the drive on flammable materials such as wood.

6) Altitude

When rated output, the altitude of the installation and use place shall not exceed 1000m.

It shall be derated in areas with an altitude of more than 1000 m, and it shall be derated at a rate of 10% for every 1000m altitude increase. The highest altitude of the installation and use site shall not exceed 3000m.

7) Vibration resistance

5~8.5Hz, displacement 3.5mm; 8.5~200Hz, acceleration is not greater than 5.9m/s2.

7.2 Main circuit wiring mode

The schematic diagrams for wiring mode and main terminal of NVF7 Series Drive are shown below.

7.4 Wiring method

7.4.1 Power grid wiring

This product is suitable for the power grid system with neutral grounding. If it is used in the IT power grid system, the internal filter element needs to be disconnected, and the external filter cannot be connected, otherwise it will cause damage to the drive or personal injury. As shown in the figure below. It is necessary to remove the ground jumper of the varistor (TVD) and the ground jumper of the safety capacitor (EMC), such as the terminals No.1 and No.2 shown in the figure below, and the filter cannot be installed, otherwise it may cause injury or drive failure. When the earth leakage circuit breaker is configured, if there is a phenomenon of tripping and leakage protection during starting, the safety capacitor (EMC) jumper to the ground can be removed, as the No.2 terminal shown in the figure on the left).

Figure 7.4.1 Schematic Diagram of the Position of Varistor (TVD) and Safety Capacitor (EMC) Jumper to Ground

Note:

IT system is a system in which the neutral point of power supply is not grounded and the exposed conductive part of electrical equipment is directly grounded. IT system can have neutral wire, but IEC strongly recommends not to set neutral wire. Because if a neutral wire is set and a grounding fault occurs at any point of the N wire in the IT system, the system will no longer be an IT system.

When the first grounding fault occurs in the IT system, it is only the non-fault capacitance current relative to the ground, and its value is very small. If the voltage of the exposed conductive part to the ground does not exceed 50V, it is not necessary to cut off the fault circuit immediately to ensure the continuity of power supply, Place of usage: It requires high continuity of power supply, such as emergency power supply, large hospital operating room, electric steelmaking, underground mine and other places. 7.4.2 Analog input terminal

Because weak analog voltage signals are particularly vulnerable to external interference, it is generally necessary to use shielded cables, and the wiring distance shall be as short as possible, not exceeding 20m. In some situations where analog signals are seriously disturbed, filter capacitors or ferrite cores shall be added to the analog signal source side.

Analog AI1 voltage input

Analog AI2 voltage input

Figure 7.4.2 Wiring Diagram of Analog Voltage Input Terminal

- 7.4.3 Digital input terminal
 - Sink wiring

Sink wiring using internal 24V power supply of inverter

Sink wiring using external 24V power supply of inverter

Using the internal 24V power supply of the drive is one of the most commonly used wiring methods. The PLC of the drive is short-circuited with the +24V terminal, and the COM terminal of the drive is connected with 0V of the external controller.

If an external 24V power supply is used, the short contact tag between +24V and PLC must be removed, the +24V positive pole of the external power supply shall be connected to the PLC terminal, and the 0V external power supply shall be connected to the corresponding X terminal through the controller control contact.

• Source wiring

Source wiring using internal 24V power supply of inverter

Source wiring using external 24V power supply of inverter

If the internal 24V power supply of drive is used, the short contact tag between +24V and PLC must be removed, PLC and COM shall be connected together, and +24V shall be connected with the common terminal of external controller.

If an external power supply is used, the short contact tag between +24V and PLC must be removed, and the PLC shall be connected with 0V of the external power supply. The 24V positive pole of the external power supply shall be connected to the corresponding terminal X through the external controller control contact.

• HDI wiring mode of high-speed input terminal

When HDI is used as a high-speed pulse input, the maximum allowable frequency is 100kHz.

Figure 7.4.5 High-speed Pulse Input

7.4.4 Digital output terminal

When the digital output terminal needs to drive the relay, absorption diodes shall be installed on both sides of the relay coil. 24V power supply damage. The driving capacity is no more than 50mA.

Figure 7.4.6 Schematic Diagram of Digital Output Terminal Wiring

When HDO terminal is continuous pulse output, the maximum output frequency is 100kHz.

7.5 First start-up step

- The following describes the basic setting steps required for the initial start of the drive.
- Process 1: Basic debugging process

| Common Parameter List | | | | | |
|-----------------------|--|--|------------------------|--------|--|
| Parameters | Name | Setting range | Factory value | Change | |
| F0-02 | Run instruction selection | 0: Operation panel 1: Terminal 2: Communication | 0 | 0 | |
| F0-03 | Main frequency instruction input selection | 0: Digital setting (without power-off memory) 1: Digital setting (with power-off memory) 2: Al1 3: Al2 4: Al3 5: Pulse setting (HDI) 6: Multi-segment instruction 7: Simple PLC 8: PID 9: Communication setting | 0 | 0 | |
| F0-08 | Preset frequency | 0.00Hz ~ maximum frequency (F0-10) | 50.00Hz | 0 | |
| F0-09 | Direction of operation | 0: Run in the default direction 1: Run in the opposite direction to the default direction | 0 | 0 | |
| F0-17 | Acceleration time 1 | 0.00s~650.00s(F0-19=2) 0.0s~6500.0s(F0-19=1) 0s~65000s(F0-19=0) | Model determination | 0 | |
| F0-18 | Deceleration time 1 | 0.00s~650.00s(F0-19=2) 0.0s~6500.0s(F0-19=1) 0s~65000s(F0-19=0) | Model determination | 0 | |
| F0-28 | Parameter initialization | 0: No operation 01: Clear record information 02: Restore factory parameters, excluding motor parameters 04: Back up user's current parameters 05: Restore user backup parameters | 0 | 0 | |
| F1-00 | Startup mode | 0: Direct startup 1: Speed tracking and restart 2: Pre-excitation start (AC asynchronous machine) 3: SVC quick start | 0 | 0 | |
| F1-03 | Starting frequency | 0.00Hz~50.00Hz | 0.00Hz | 0 | |
| F1-04 | Holding time of starting frequency | 0.0s~100.0s | 0.0s | 0 | |

• Process 2: Self-learning process of induction motor

Figure 7.5.2 Self-learning of Induction Motor

7.6 Confirmation items of drive at initial startup

Please confirm the items in Table 7.6.1 before the drive is powered on.

| Phase | Items | Items Content | |
|--------------------------------|--|---|--|
| | Input power voltage | Please confirm whether the input power specification is consistent with the product specification 220V grade: 380V grade: | |
| | Main circuit input power supply wiring | Please confirm that the input power supply is correctly connected to the terminal R/S/T S/T | |
| | Main circuit output and motor wires | Please confirm that the output terminal U/V/W and the motor terminal U/V/W are connected correctly, and the screws are fastened according to the torque requirements | |
| Before power-on | Braking resistor/Braking resistor wiring | Please confirm whether the product model has braking function Please make sure that the braking resistor is correctly connected to the "+" terminal and the "B terminal" Please make sure that the external braking unit is properly connected to the "+" and "." terminals | |
| | Grounding | Please confirm that the drive and motor are properly grounded, the grounding wire meets the requirements and the screws are fastened according to the torque requirements | |
| | Control circuit wiring | Please confirm that the control circuit is correctly wired and the control terminal screws are fastened according to the torque requirements. | |
| | Motor and mechanical load connection | Before the first operation, please ensure that the motor shaft and the mechanical load remain separated, and then connect the mechanical load after the motor runs properly without load Please confirm the distance between the drive and the motor and the cable length | |
| | Operation panel state | The drive is in standby state and in trouble-free state (Figure) | |
| After power-on | DC bus voltage | Press the ">" key to switch, and confirm that the bus voltage meets the requirements The DC bus voltage VDC is about 1.4 times of the AC input voltage Vin | |
| First debugging preparation | Debug according to specifications | See Chapter 7.4 | |

Table 7.6.1 Confirmation Items of Drive at Initial Startup

7.7 Usage of operation panel

7.7.1 LED operation panel

Figure 7.7.1 Operation Panel Diagram

• Description of indicators:

The indicators are divided into state indicators and unit indicators. The state indicator are described as follows:

| Indicator | Display state | Display description |
|-----------------------------------|---------------|------------------------|
| DUN (mm in star stir a) | On | Running state |
| RON (run instruction) | Off | Stop state |
| | Off | Panel control |
| LOC/REM (control mode indication) | On | Terminal control |
| | Flash | Communication control |
| | On | Reverse running |
| F/R (difection indication) | Off | Forward running |
| | On | In torque control |
| ALM (fault indication) | Slow flash | Motor parameter tuning |
| | Fast flash | Drive fault |

The unit indicator is specified as follows:

| Description of key functions: | | | |
|-------------------------------|----------------------|---|--|
| Key | Function | Description | |
| (PRG) | Programming key | Enter the primary interface/Return to the previous interface | |
| (SET) | Enter key | Enter key (to confirm data or operation/enter the next menu) | |
| | Ascending key | Ascending key (to change group number, index number and parameter value) | |
| | Descending key | Descending key (to change group number, index number and parameter value) | |
| | Shift key | When setting parameters, move and select the position to be modified | |
| (RUN) | Run key | Start-stop control of drive | |
| STOP RST | Stop/Reset key | In running state, it is used for stop operation; In fault state, it is used for reset operation | |
| MF | Multifunction key | Execute the action according to the setting function of parameter F7-02 | |
| QUICK | Menu mode key | Multiple menu mode switching | |

• Parameter modeoperation

This series drive provides three modes for finding function codes:

- (1) display all function code parameters of the drive
- (2) Users can select and customize the commonly used function codes, up to 32 of which can be customized to form a user-defined function code set; The user determines the functional parameters to be displayed through the FF group

(3) Drive automatically searches to find out the function code different from the factory value for users to choose quickly;

The display modes of the three function codes are switched by <Menu Mode> on the panel. When switching to the selected mode, press <Enter Key> to select it, and when entering the menu to view the parameters, the parameters will be displayed in the selected mode. Various modes are displayed as follows:

| Parameter display | Display |
|---------------------------|---------|
| All functional parameters | -ALL- |
| User-defined parameters | U |
| User-changed parameters | C |

Figure 7.7.3 Selection of Menu Mode Operation

• Parameter setting

The operation panel of the drive adopts three-level menu structure for parameter setting and other operations. Three-level menus are: Functional parameter group (level I menu) \rightarrow Function code (level II menu). \rightarrow Function code set value (level III menu). The operation flow is as follows:

Figure 7.7.4 Parameter Setting Operation

NVF7 Series Drive Operation Instructions

Press PRG key or SET key to return to level II menu when operating in the level III menu. The difference is as follows: press SET to save the set parameters, then return to level II menu and automatically transfer to the next function code; press PRG to abandon the current parameter modification and directly return to the level II menu of the current function code number.

In the Level III menu state, if the parameter does not flash, it means that the function code cannot be modified. The possible reasons are as follows:

- 1) This function codes are non-modifiable parameters, such as drive type, actual detection parameters, operation record parameters, etc.
- 2) This function code cannot be modified in the running state, and can only be modified after stopping the machine.
- 3) The parameters are protected. F7-11 is set to 1 (all function codes cannot be modified)

7.7.2 LCD operation panel

| Operation | Operation panel functions: | | | | |
|-------------------------------|----------------------------|--|--|--|--|
| Кеу | Name | Function | | | |
| | Left function key | Back key, used to return to the interface | | | |
| | Right function key | OK key, used to enter the interface | | | |
| | UP key | It is used for up and down selection and data modification | | | |
| | DOWN key | It is used for up and down selection and data modification | | | |

| Кеу | Name | Function |
|------|-----------|--|
| | Right key | It is used for scrolling display and data modification of each interface |
| | Right key | It is used for scrolling display and data modification of each interface |
| [OK] | OK key | Save key after modifying parameters in parameter interface |
| RUN | Run key | Start key of drive |
| STOP | Stop key | Stop key of drive |

• Panel LCD indicator description:

| LCD indicator color | Indication state |
|---------------------|------------------|
| Off | Standby state |
| Green | Running state |
| Red light flashing | Fault state |

7.8 Motor self-learning

Please select the most suitable self-learning mode according to the type of motor used, the control mode of drive and the installation environment of motor.

Warning! When dynamic self-learning is selected, the motor will rotate at a speed of more than 50% of the rated frequency. Please make sure the surrounding area is safe.

Self-learning of induction motor

Please input the motor parameters according to the motor nameplate before self-learning:

| | Self-learning related parameters of induction motor | | | | |
|-------|---|---|------------------------|---|--|
| F2-00 | Motor type selection | 0: Normal asynchronous motor 1: Frequency conversion asynchronous motor | 0 | ۲ | |
| F2-01 | Rated power of motor | 0.1kW~1000.0kW | Model determination | 0 | |
| F2-02 | Rated voltage of motor | 1V~2000V | Model determination | | |
| F2-03 | Rated current of motor | 0.01A~655.35A (drive power ≤ 55kW) 0.1A~6553.5A (drive power >55kW) | Model determination | ۲ | |
| F2-04 | Rated frequency of motor | 0.01Hz~maximum frequency | Model determination | 0 | |
| F2-05 | Rated speed of motor | 1rpm~65535rpm | Model determination | 0 | |
| Fd-00 | Number of encoder lines | 1~65535 | 1024 | ۲ | |
| Fd-01 | Encoder type | 0: ABZ incremental encoder 2: Resolver | 0 | | |

| Self-learning related parameters of induction motor | | | | | | |
|---|--|--------------------------|---|---|--|--|
| Fd-03 | ABZ incremental encoder AB phase sequence | 0: Forward 1: Reverse | 0 | | | |
| Fd-07 | Pole pairs of resolver | 1~65535 | 1 | 0 | | |

Where Fd-00, Fd-01, Fd-03 and Fd-07 are the parameters that need to be set in the control with PG feedback.

Selection of self-learning mode for induction motor:

| Method | Parameters | Use conditions | Tuning ffect |
|-------------------------------|------------|--|--------------|
| Dynamic self-learning | F2-37 = 2 | When the motor can be separated from the mechanical load and the motor is running properly during self-learning When running the motor with constant output characteristics When high-precision control is required When the motor cannot be separated from the mechanical load, but the load of the motor is less than 30% | Optimal |
| Partial static self-learning | F2-37 = 1 | When the wiring distance under V/f control is above 50 m, When the motor output and drive capacity are different | General |
| Complete static self-learning | F2-37 = 3 | When the motor cannot be separated from the mechanical load, and the load of the motor is more than 30% | Good |

Self-learning step

| Steps | Process | | | | |
|--------|--|--|--|--|--|
| Step 1 | The run instruction of drive is selected as panel operation (F0-02 = 0) | | | | |
| Step 2 | Accurately input the motor nameplate parameters (F2-00 ~ F2-05) | | | | |
| Step 3 | Accurately input the encoder parameters (Fd-00, Fd-01, Fd-03, Fd-07), which is required for control with PG | | | | |
| | Set the motor tuning mode (F2-37), press the SET key, and the keyboard will display it | | | | |
| Step 4 | | | | | |
| Step 5 | Press the RUN key on the operation panel, the drive will drive the motor to run, and the running indicator will light up, and the ALM indicator will flash slowly. When the tuning lasts for a period of time, the indicator will go out, the code displayed on the panel will disappear, and it will return to the normal parameter display interface, indicating that the tuning is completed. The drive will automatically obtain the motor parameters according to the selected tuning mode. Induction motor: Static part parameter tuning: obtain F2-06 ~ F2-08 parameters Static complete parameter tuning: obtain F2-06 ~ F2-10 parameters Dynamic complete parameter tuning: obtain F2-06 ~ F2-10 and Fd-03 parameters Synchronous motor: Static parameter tuning: obtain F2-16~F2-18 parameters | | | | |
| | Dynamic parameter tuning: obtain F2-16~F2-18 and F2-20 parameters | | | | |

7.9 Test run

Set the basic parameters, and start the test run after self-learning of the motor.

Warning! Safety measures when restarting the machine: After the wiring operation and parameter setting are completed, please be sure to perform test run, and make sure that the machine can operate safely. If the system is used directly without test run, it may cause death or serious injury.

7.9.1 Test run under no-load state

Please confirm the running state of the motor before connecting it with the machine. Precautions before operation:

Before running the motor, please confirm the following items:

- Please confirm the safety around the motor and machine.
- Please confirm whether the emergency stop circuit and the safety device on the machine side operate correctly.

Confirmation items during running:

Confirm the following items during running:

- Whether the motor is forward running.
- Whether the motor rotates smoothly (whether there is abnormal sound and vibration).
- Whether the acceleration and deceleration of the motor are smooth.

7.9.2 No-load run

No-load test run steps are as follows.

- 1) Set F0-08 to 5.00Hz (target operating frequency).
- 2) Press RUN. The running indicator is on, and the motor rotates forward at 5.00Hz.
- 3) Make sure that the motor rotates in the correct direction, and the drive shows no fault. When a fault is displayed, troubleshoot it.

Forward running direction of the motor: (counterclockwise as viewed from the load shaft)

- 4) Increase the set value of F0-08 to improve the motor operating frequency. When increasing the operating frequency, please confirm the responsiveness and adjust the set value by 10Hz.
- 5) Press > shift key, the panel indicator A will light up, and the panel will display the current output current. If the output current of the drive does not exceed the rated current of the motor, it is in normal state.
- 6) After confirming that the motor can run properly, press STOP. When the motor stops, the RUN indicator goes out.

7.9.3 Actual load test run

After confirming the running in no-load state, connect the motor with the mechanical system for test run. Precautions before operation:

Before running the motor, please confirm the following items:

- Please confirm the safety of the motor and its surroundings.
- Please confirm whether the emergency stop circuit and the safety device on the machine side operate correctly.
- Please make sure that the motor stops completely.

NVF7 Series Drive Operation Instructions

• Please connect the motor and the machine.

Please confirm whether the mounting screws are loose and fix the motor shaft and mechanical system. Please be prepared to press the STOP key at any time in case of abnormal action.

Confirmation items during running:

- Whether the machine moves in the right direction (whether the motor rotates in the right direction).
- Whether the acceleration and deceleration of the motor are smooth.

7.9.4 On-load test run

After the motor is connected to the machine, please implement test run according to the same operation steps as no-load operation.

- Please confirm whether the output current displayed on the panel is too large.
- 1) Set F0-08 to 5.00Hz (target operating frequency).
- 2) Press RUN. The running indicator is on, and the motor rotates forward at 5.00Hz.
- 3) Make sure that the motor rotates in the correct direction, and the drive shows no fault. When a fault is displayed, troubleshoot it.
- 4) Increase the set value of F0-08 to improve the motor operating frequency. When increasing the operating frequency, please confirm the responsiveness and adjust the set value by 10Hz.
- 5) Press > shift key, the indicator A on the right of the panel will light up, and the panel will display the current output current. If the output current of the drive does not exceed the rated current of the motor, it is in normal state.
- 6) After confirming that the motor can run properly, press STOP. When the motor stops, the RUN indicator goes out.
- 7) Change the target frequency and rotation direction, and confirm whether there is abnormal sound and vibration.
- 8) In case of control failures such as maladjustment or vibration, please make adjustments.
- 7.10 Adjustment of control performance during test run
 - Set the basic parameters, and start the test run after self-learning of the motor.

Warning! Safety measures when restarting the machine: After the wiring operation and parameter setting are completed, please be sure to perform test run, and make sure that the machine can operate safely. If the system is used directly without test run, it may cause death or serious injury.

• VF control of induction motor

| Failure | Parameter No. | Measures | Factory setting | Recommended value |
|---|---|--|------------------------|-------------------|
| Maladjustment and vibration occur at medium speed (10 Hz~40 Hz) | F4-11 (oscillation suppression gain) | In case of maladjustment and vibration, raise the set value. | 40 | 0~100 |
| Motor is noisy Maladjustment and vibration occur at low speed (below 10 Hz) and medium speed (10 Hz~40 Hz) | F0-15 (carrier frequency) | Motor is noisy, raise the carrier frequency Low and medium speed maladjustment and vibration, lower the carrier frequency | Model determination | |
| Insufficient torque at low speed (below 10Hz). | F4-01 (Torque boost) | Operating parameters have been identified, and automatic torque boost can be set | Model determination | 0.0% ~ 30.0% |

| Failure | Parameter No. | Measures | Factory setting | Recommended value |
|--|---|--|------------------------|-------------------|
| Insufficient torque at low speed (below 10Hz). | F4-01 (Torque boost) | Without parameter identification, increase the parameters according to the actual situation | Model determination | 0.0% ~ 30.0% |
| Large starting impact | F4-01 (Torque boost) | According to the actual situation, lower the parameters Perform parameter identification and set it to automatic torque boost | Model determination | 0.0% ~ 30.0% |
| Large inertia load, and F4-23 report overvoltage when (Overvoltage rapid deceleration stall enabled) | | Enable overvoltage stall protection function | 1 | |
| Poor speed accuracy | F4-09 (slip compensation coefficient) | Adjust this compensation value according to the actual situation | 0.0% | 0.0% ~ 200.0% |

• PG-free vector control of induction motor

| Failure | Parameter No. | Measures | Factory setting | Recommend ed value |
|--|--|--|---------------------------------|----------------------------------|
| Slow response of | Speed loop proportional gain F3-01 (low speed) F3-04 (high speed) | When the response of torque and speed is slow, lower the set | 20 | 1~100 |
| torque and speed | Speed loop integration time F3-02 (low speed) F3-05 (high speed) | In case of maladjustment and vibration, raise the set value | 0.5 | 0.01~10.00 |
| The proportional gain and time of ASR cannot be ensured at low speed or high speed | F3-03 (speed loop switching frequency 1) F3-06 (speed loop switching frequency 2) | Switch the ASR proportional gain and integration time according to the output frequency | F3-03: 5Hz F3-06: 10Hz | Make adjustments as needed |
| Large inertia load, and report overvoltage when rapid deceleration | F3-23 (Power generation limit enabled) | Enable the power generation limit function, and adjust F3-24 and F3-25 as required | 0 | |
| Poor speed accuracy | F3-07 (Vector control slip gain) | Adjust this compensation value according to the actual situation | 100% | 50% ~200% |
| Motor is noisy Maladjustment and vibration occur at low speed (below 3Hz) | F0-15 (carrier frequency) | Motor is noisy, raise the carrier frequency Maladjustment and vibration at low speed, lower the carrier frequency | Model determina tion | |

| Failure | Parameter No. | Measures | Factory setting | Recommend ed value |
|---|--|--|---------------------------|----------------------------------|
| Slow response of | Speed loop proportional gain F3-01 (low speed) F3-04 (high speed) | When the response of torque and speed is slow, lower the | 20 | 1~100 |
| torque and speed | Speed loop integration time F3-02 (low speed) F3-05 (high speed) | In case of maladjustment and vibration, raise the set value | 0.5 | 0.01~10.00 |
| The proportional gain and time of ASR cannot be ensured at low speed or high speed | F3-03 (speed loop switching frequency 1) F3-06 (speed loop switching frequency 2) | Switch the ASR proportional gain and integration time according to the output frequency | F3-03: 5Hz F3-06: 10Hz | Make adjustments as needed |
| Motor is noisy Maladjustment and vibration occur at low speed (below 3 Hz) | F0-15 (carrier frequency) | Motor is noisy, raise the carrier frequency Maladjustment and vibration at low speed, lower the carrier frequency | Model determination | |

• PG vector control of induction motor

7.11 Confirmation table during test run

During the test run, please confirm according to the following steps:

(1) Before the first test run

| Inspection | Ser.No. | Content | |
|------------|---------|---|--|
| | 1 | Whether the correct installation and wiring is completed according to the specifications | |
| | 2 | Whether to disconnect the mechanical load connected to the motor shaft | |
| | 3 | Whether the motor shaft can rotate | |
| | 4 | Whether the drive is set with automatic start function | |
| | 5 | Whether the drive is powered on | |

(2) First test run

| Inspection | Ser.No. | Content |
|------------|---------|---|
| | 1 | Whether to complete the "heavy load or light load" model setting according to the |
| | 1 | load characteristics |
| | 2 | Whether to set motor parameters |
| | 3 | Whether the operating frequency is appropriately reduced, such as 10Hz |
| | 4 | Whether the drive can start properly |
| | | Whether the motor rotates and whether the motor rotates in the correct direction |
| | 5 | If the motor rotates in the wrong direction, whether any two-phase U/V/W cables |
| | | have been exchanged |
| | 6 | Whether to complete the motor parameter self-learning |

8 Precautions in repair, maintenance and storage

Due to the influence of environmental temperature, humidity, dust and vibration, aging and wear of devices inside the drive and many other reasons, potential failures of the drive will occur. Therefore, it is necessary to carry out daily and regular maintenance of the drive.

Note: Before inspection and maintenance, please confirm the following items first, otherwise it may cause electric shock:

- (1) The power supply of the drive has been cut off;
- (2) After the cover plate is opened, the charging indicator goes out;
- (3) The voltage between DC buses measured by DC voltmeter is less than 36V.

8.1 Daily maintenance and care

- Daily inspection: In principle, check whether there is any abnormality during operation:
- 1) Whether the motor runs as set;
- 2) Whether the environment of the installation site is abnormal;
- 3) Whether the cooling system is abnormal;
- 4) Whether there is abnormal vibration sound;
- 5) Whether there is overheating and discoloration;
- 6) Measure the input voltage of drive with multimeter during operation.

8.2 Regular inspection and maintenance

Depending on the use environment, users can check the drive once every 3 or 6 months.

When the drive is regularly maintained and inspected, the power supply must be cut off. After the monitor (keyboard) is not displayed and the power indicator of the main circuit is turned off for 10 minutes, the multimeter is used to detect that the DC bus voltage of and is less than 25V, so as to avoid the residual voltage of the capacitor of the drive from hurting the maintenance personnel.

- (1) Cooling system: Please clean the air filter and check whether the cooling fan is normal.
- (2) Screws and bolts: Due to the influence of vibration and temperature change, the fixed parts such as screws and bolts may be loose. Check whether they are reliably tightened, and tighten them according to the tightening torque.
- (3) Check whether conductors and insulators are corroded or damaged.
- (4) Measure the insulation resistance.
- (5) Check the filter capacitor for discoloration, odor, bubbling, liquid leakage, etc.

Figure 8.2.1 Insulation Resistance Test of Main Circuit

The drive must be operated according to the specified use environment, and some unexpected situations may occur during operation. Users shall carry out daily maintenance according to the tips in the following table. It is a good way to prolong the service life of the drive to keep a good operating environment, record the daily operation data and find the exception reasons as soon as possible.

NVF7 Series Drive Operation Instructions

| Check | Insp | | | | |
|-------------------------------|--------------------------------|-------------|----------------------------------|---|--|
| object | Check content | Period | Inspection means | Judgment criteria | |
| Operating environment | 1. Temperature and humidity | | 1. Thermometer and hygrometer | 1. (-10 ~+45)°C, (45 ~ 55)°C for derating | |
| | 2. Dust, water and dripping | Any time | 2. Visual inspection | 2. No water leakage trace | |
| | 3. Gas | | 3. Smell | 3. No peculiar smell | |
| Drive | 1. Vibration, fever | Any time | 1. Shell touch | 1. Stable vibration and reasonable fan temperature | |
| | 2. Noise | | 2. Hearing | 2. No unusual noise | |
| Martin | 1. Heating | | 1. Hand touch | 1. No abnormality in heating | |
| Niotor | 2. Noise | Any time | 2. Hearing | 2. Uniform noise | |
| Running state parameter | 1. Output current | | 1. Ammeter | 1. In the rated range | |
| | 2. Output voltage | Any time | 2. Voltmeter | 2. In the rated range | |
| | 3. Internal temperature | , any unite | 3. Thermometer | 3. Temperature rise less than 35K | |

Table 8.2.1 Tips for Daily Inspection

8.3 Replace wearing parts

The wearing parts of drive mainly include cooling fan and electrolytic capacitor for filtering, and their service life is closely related to the use environment and maintenance state. The general service life is shown in the following table.

Table 8.3.1 Component Service Life

| Device name | Service life |
|------------------------|---------------------|
| Fan | (3 ~ 4) 0,000 hours |
| Electrolytic capacitor | (4 ~ 5) 0,000 hours |
| Relay | About 100,000 times |

Users can determine the replacement period according to the running time.

(1) Cooling fan

Possible causes of damage: Bearing wear and blade aging.

Criterion: Whether there are cracks in the fan blades, etc., and whether there is abnormal vibration sound during startup.

(2) Filter electrolytic capacitor

Possible causes of damage: High ambient temperature, frequent load jump causing increased pulsating current and aging electrolyte.

Criterion: Whether there is liquid leakage, whether the safety valve is protruding, the measurement of electrostatic capacitance and insulation resistance.

(3) Relay

Possible causes of damage: Corrosion, frequent action.

Criterion: On-off failure.

8.4 Storage life and precautions

Users must pay attention to the following for temporary storage and long-term storage after purchasing the drive:

- Avoid storing it in places with high temperature, humidity and rich dust and metal dust, and ensure good ventilation;
- (2) The drive stored for a long time must be electrified once within 2 years. When electrified, use the voltage regulator to slowly rise to the rated value, and electrify the drive for 1 hour without load.

9 Fault analysis and elimination

The following fault types may be encountered during the use of the drive. Please refer to the following methods for simple fault analysis:

| Fault name | Panel display | Troubleshooting | Fault handling measures |
|----------------------------|-----------------------------|--|--|
| | | The drive output circuit is grounded or short-circuited | Eliminate peripheral faults, and detect whether the motor or interrupt contactor is short-circuited |
| | | The control mode is FVC or SVC without parameter identification | Set the motor parameters according to the motor nameplate and identify the motor parameters |
| | | Under the rapid acceleration condition, the acceleration time is set too short | • Increase the acceleration time |
| Accelerated overcurrent | E.OC1 (Fault code 02) | The overcurrent stall suppression setting is not appropriate | Confirm that the overcurrent stall suppression function (F4-19) has been enabled; The set value of the overcurrent stall action current (F4-18) is too large, and it is recommended to adjust it within 120% to 150%; The overcurrent stall suppression gain (F4-20) is set too small, and it is recommended to adjust it within 20 to 40; |
| | | The manual torque boost or V/F | Adjust the manual boost torque or V/F |
| | | Start the rotating motor | Select the speed tracking start or wait for the motor to stop before starting |
| | | Subject to external interference | Check the historical fault records. If the current value is far from the overcurrent point value at the time of fault, find the interference source. If there is no other interference source, it may be the driving board or hall element problem. |
| Decelerated overcurrent | E.OC2 (Fault code 03) | The drive output circuit is grounded or short-circuited | Eliminate peripheral faults and detect whether the motor is short-circuited or open-circuited |
| | | The control mode is FVC or SVC without parameter identification | Set the motor parameters according to the motor nameplate and identify the motor parameters |
| | | In case of sudden deceleration, the deceleration time is set too | Increase deceleration time |

Table 9.1.1 Common Fault Codes of Drive and Troubleshooting Methods

| Fault name | Panel display | Troubleshooting | Fault handling measures |
|----------------------------------|-----------------------------|---|--|
| Decelerated | E.OC2 (Fault | The overcurrent stall suppression setting is not appropriate | Confirm that the overcurrent stall suppression function (F4-19) has been enabled; The set value of the overcurrent stall action current (F4-18) is too large, and it is recommended to adjust it within 120% to 150%; The overcurrent stall suppression gain (F4-20) is set too small, and it is recommended to adjust it within 20 to 40; |
| | code 03) | No braking unit and braking resistor are installed | Add braking unit and resistor |
| | | Subject to external interference | Check the historical fault records. If the current value is far from the overcurrent point value at the time of fault, find the interference source. If there is no other interference source, it may be the driving board or hall element problem. |
| Constant speed overcurrent | E.OC3 (Fault code 04) | The drive output circuit is grounded or short-circuited | Eliminate peripheral faults and detect whether the motor is short-circuited or open-circuited |
| | | The control mode is FVC or SVC without parameter identification | • Set the motor parameters according to the motor nameplate and identify the motor parameters |
| | | The overcurrent stall suppression setting is not appropriate | Confirm that the overcurrent stall suppression function (F4-19) has been enabled; The set value of the overcurrent stall action current (F4-18) is too large, and it is recommended to adjust it within 120% to 150%; The overcurrent stall suppression gain (F4-20) is set too small, and it is recommended to adjust it within 20 to 40; |
| | | Drive type selected is too small | In the stable running state, if the running current has exceeded the rated current of the motor or the rated output current of the drive, please select a drive with a higher power level |
| | | Subject to external interference | • Check the historical fault records. If the current value is far from the overcurrent point value at the time of fault, find the interference source. If there is no other interference source, it may be the driving board or hall element problem. |

| Fault name | Panel display | Troubleshooting | Fault handling measures | |
|----------------------------------|-----------------------------|---|---|--|
| | | The input voltage is too high | Adjust the voltage to the normal range | |
| Accelerated overvoltage | E.OU1 (Fault code 05) | There is an external force to drag the motor to run during acceleration | Cancel the external force or install a braking resistor | |
| | | The overvoltage suppression setting is not appropriate | Confirm that the overvoltage suppression function (F4-23) has been enabled; The set value of overvoltage suppression action voltage (F4-22) is too large, and it is recommended to adjust it within 700V~770V for 380V models and 350V~380V for 220V models; The overvoltage suppression gain (F4-24) is set too small, and it is recommended to adjust it within 30 to 50; | |
| | | No braking unit and braking resistor are installed | Add braking unit and resistor | |
| | | The acceleration time is too short | Increase the acceleration time | |
| Decelerated overvoltage | E.OU2 (Fault code 06) | The overvoltage suppression setting is not appropriate | Confirm that the overvoltage suppression function (F4-23) has been enabled; The set value of overvoltage suppression action voltage (F4-22) is too large, and it is recommended to adjust it within 700V~770V for 380V models and 350V~380V for 220V models; The overvoltage suppression gain (F4-24) is set too small, and it is recommended to adjust it within 30 to 50; | |
| | | There is an external force to drag the motor to run during deceleration | Cancel the external force or install a braking resistor | |
| | | Deceleration time is too short | Increase deceleration time | |
| | | No braking unit and braking resistor are installed | Add braking unit and resistor | |
| Constant speed overvoltage | E.OU3 (Fault code 07) | The overvoltage suppression setting is not appropriate | Confirm that the overvoltage suppression function (F4-23) has been enabled; The set value of overvoltage suppression action voltage (F4-22) is too large, and it is recommended to adjust it within 700V~770V for 380V models and 350V~380V for 220V models; The overvoltage suppression frequency gain (F4-24) is set too small, and it is recommended to adjust it within 30 to 50; The maximum rising frequency of overvoltage suppression (F4-26) is set too small, so it is recommended to adjust it within 30 to 30; | |
| | | There is an external force to drag the motor to run during running | Cancel the external force or install a braking resistor | |

| Fault name | Panel display | Troubleshooting Fault handling measures | |
|------------------------|-----------------------------|--|--|
| Buffer power fault | E.RES (Fault code 08) | Bus voltage fluctuates at the undervoltage point | Seek technical support |
| | | Momentary power failure | Enable the instant stop function (FE-59) to prevent instantaneous power failure and undervoltage fault |
| Undervoltag e fault | E.UV (Fault | The input terminal voltage of the drive is not in the range required by the specification | Adjust the voltage to the normal range |

| Fault name | Panel display | Troubleshooting | Fault handling measures | |
|---|-----------------------------|---|--|--|
| Initial position detection error | E.POS (Fault code 51) | When using synchronous motor SVC vector control, the connection between drive and motor is incorrect | • Detect the output wiring of drive | |
| Master-slav e control slave fault | E.P2P (Fault code 55) | Slave is faulty. Check the slave | • Troubleshoot according to the slave fault code | |
| Braking unit overload | E.BOL (Fault code 61) | The brake resistance value is too small | Please refer | |
| The brake circuit is short | E.BSH (Fault code 62) | The brake module is abnormal | Seek technical support | |

10 Warranty period and environmental protection and other legal provisions

10.1 Warranty period

Under normal storage and transportation conditions, and the product packaging is intact or the product itself is intact, the warranty period is 12 months from the date of purchase by the user or 18 months from the date of production, whichever comes first.

The following situations are not covered by the warranty:

- 1) Damage caused by improper use, storage and maintenance of users;
- Damage caused by institutions or personnel not appointed by the Company or their disassembly and maintenance without permission;
- 3) The product exceeds the warranty period;
- 4) Damage caused by force majeure;
- 5) When the bar code, nameplate and other marks identified by the manufacturer in the product are damaged or unrecognizable;
- 6) When the user fails to pay the purchase price according to the Sales Contract signed by both parties;
- 7) When the user intentionally conceals the improper use of the product in the installation, wiring, operation, maintenance or other processes from the after-sales service provider of the manufacturer.
- 8) Our company has the right to entrust others to provide warranty services of the faulty products, and the relevant service fees are calculated according to the actual costs. If there is an agreement, the agreement shall prevail.
- 9) Our sales and agency in China can provide after-sales service for this product.

10.2 Environmental protection

In order to protect the environment, when this product or any of its components is scrapped, please dispose of it properly as industrial waste; Or hand it over to the recycling station for classification, disassembly, recycling and reuse in accordance with relevant national regulations.

1 Product selection and ordering instructions

11.1 Heavy load rating and light load rating

NVF7 Series Drive can meet two kinds of load applications: heavy load (T-type) and light load (P-type). The main differences between heavy load applications and light load applications are shown in the following table.

| Load | Corresponding torque characteristics | Common load | Overload capacity | Parameter setting |
|---------------|---|--|--|----------------------|
| Heavy Ioad | Constant torque | Extruder Conveyor belt Crane-lifting, translation Other constant torque or high overload applications | 150% rated current under heavy load for 60s Allow 1 overload every 10 minutes | F0-00=1 |
| Light Ioad | Variable torque | Fan Water pump Other variable torque or light load applications | 110% rated current under light load for 60s Allow one overload every 10 minutes | F0-00=2 |

Table 11.1.1 Heavy Load Rating (T-type) and Light Load Rating (P-type)

11.2 Derating of drive

When selecting and using the product, please ask users to determine whether to derate it according to the actual use situation. Derating is considered mainly in the following circumstances:

Ambient temperature and derating

When the ambient temperature exceeds 40°C, it needs to be derated. It shall be derated by 1.5% for every 1°C increase in ambient temperature, and the maximum ambient temperature is 50°C.

Altitude and derating

In the area where the altitude exceeds 1000m, the heat dissipation effect of the drive becomes worse due to the thin air, so it needs to be derated (it shall be derated by 1% for every increase of 100m in altitude, and the maximum altitude is 3000m).

Parallel operation and derating

When multiple drives are connected in parallel and installed compactly (the interval between two drives is less than 5mm), they need to be derated by 70%-80% according to the actual application environment. Please consult our company for details.

11.3 Other optional accessories

Other supported optional accessories are shown in the following table.

Table 11.3.1 Other Optional Accessories

| Name | Model | Applicable model | Remarks |
|---|---------------|------------------|---------|
| Display extension cable (network cable) | V/A7CD04 | | |
| Operation panel extension cable | VA7CB04 | whole series | |
| Display extension cable (network cable) | 1476000 | | |
| Operation panel extension cable | VA7CB02 | whole series | |
| LED operation panel | N/A 7// 5//04 | Market and the | |
| LED Operation panel | VA/KEYUI | whole series | |
| LCD operation panel | 1/4 7/(5)(0.2 | Miles Less free | |
| LCD Operation panel | VA/KEYU2 | whole series | |
| Panel mounting bracket | 14745100 | | |
| Operation panel mounting bracket | VA/KEYU3 | whole series | |

11.4 Selection of peripheral devices of the main circuit

In the application of drive products, it plays an important role in the reliable operation of the product to reasonably select the appropriate peripheral devices of the main circuit. For the selection of peripheral devices of the main circuit, please refer to the product selection catalogue of our company. For details, please consult the agent distributor or sales manager.

| Name | Model | Description |
|-----------------------------|---------------|---|
| Breaker | General | The time characteristics of the circuit breaker shall fully consider the time characteristics of the drive overload protection, and the capacity of the circuit breaker is 1.2~2 times of the rated current of the drive; In order to avoid the power grid impact caused by short circuit or internal fault at the output end of the drive, a circuit breaker must be installed at the input end of the drive. |
| Contactor | General | In order to ensure safety, please use contactors, but do not control the start and stop of the drive through contactors. Frequent connection and disconnection of contactors will reduce the service life of the drive. |
| Input AC reactor | ACL series | Please connect the AC reactor at the input end of the drive or install the DC reactor at the terminal of the DC reactor in case of any of the following circumstances 1. The power supply of the drive is more than 600kVA or the power supply capacity is more than 10 times that of the drive; 2. Where there is a switched reactive power compensation capacitor or a thyristor-controlled load on the same power supply node, and a large peak current will flow into the input power supply circuit, which will cause damage to some rectifier devices; 3. When the voltage imbalance of the three-phase power supply of the drive exceeds 3%, which will cause damage to some rectifier devices; 4. The input power factor of the drive is required to be greater than 90%. |
| Input noise filter | General | The noise of the drive from the power input end can be reduced, and the noise from the drive output to the power end can also be reduced. |
| DC reactor | DCL series | Please connect the AC reactor at the input end of the drive or install the DC reactor at the terminal of the DC reactor in case of any of the following circumstances 1. The power supply of the drive is more than 600kVA or the power supply capacity is more than 10 times that of the drive; 2. Where there is a switched reactive power compensation capacitor or a thyristor-controlled load on the same power supply node, and a large peak current will flow into the input power supply circuit, which will cause damage to some rectifier devices; 3. When the voltage imbalance of the three-phase power supply of the drive exceeds 3%, which will cause damage to some rectifier devices; 4. The input power factor of the drive is required to be greater than 90%. |
| Output noise filter | General | Connecting a noise filter to the output of the drive can reduce the conduction and radiation interference. |
| Output AC reactor | OCL series | When the connecting line from the drive to the motor is more than 100 m, it is suggested to install an AC output reactor that can suppress high-frequency oscillation, in order to avoid motor insulation damage, excessive leakage current and frequent protection of the drive. |
| Output noise filter | General | Connecting a noise filter to the output of the drive can reduce the conduction and radiation interference. |
| External braking unit | General | For medium-high power drive without built-in braking unit, or multiple drives sharing DC bus, the load motor has a large feedback energy. |
| Braking resistor | General | The mechanical energy in the process of motor braking can be consumed in the form of heat energy through the braking resistor, which can shorten the deceleration time of the drive transmission system. |

(1) The wiring length of the brake unit should not exceed 10 meters, and twisted-pair wires or close twin wires should be used for parallel wiring.

(2) When connecting an external brake unit or an external brake resistor, change the "Overvoltage stall selection" to "Prohibit"; otherwise, the unit will not stop within the set deceleration time.

| | Setting range | 2 | P type (fan, | water pu | mp load type) | | |

This parameter can be changed in shutdown state. After modifying this parameter, the relevant parameters of drive model and motor will be automatically modified.

| | The first motor control mo | de | Factory value | ue 0 Attribute © | | 0 |
|-------|----------------------------|----|---------------------------------|------------------|-----|---|
| F0-01 | | 0 | Sensorless vector control (SVC) | | | |
| | Setting range | 1 | Flux Vector Control (FVC) | | | |
| | | 2 | \ | //F cont | rol | |

0: Sensorless vector control is suitable for high performance control occasions.

- 1: Flux vector control, the motor end must be equipped with an encoder, and the drive must be equipped with the same type of PG card as the encoder. It is suitable for high-precision speed control or torque control.
- 2: V/F control is suitable for situations where the load requirements are not high, or one drive drives multiple motors, such as fans and pumps.

| | Run instruction selection | n | Factory value | 0 | Attribute | 0 |

| | | 6 | Multi-segment instruction | | | |
| | | 7 | S | imple P | PLC | |
| | | 8 | | PID | | |
| | | 9 | Communication setting | | | |

0: Digital setting (without power-off memory)

The initial value of the set frequency is the value of F0-08 "preset frequency". The set frequency value of the drive can be modified by the \blacktriangle key and \blacktriangledown key of the keyboard (or the UP and DOWN of the multi-function input terminal). When the drive is powered off and powered on again, the set frequency value is restored to F0-08 "digital setting preset frequency".

1: Digital setting (with power-off memory)

The initial value of the set frequency is the value of F0-08 "preset frequency". The set frequency value of the drive can be modified by the \blacktriangle key and \triangledown key of the keyboard (or the UP and DOWN of the multifunction input terminal). When the drive is powered off and powered on again, set the frequency value as the modified value.

2: AI1

3: AI2

4: AI3

The frequency is given through the analog input terminal.

5: Pulse given (HDI)

Frequency is set by high-speed pulse at terminal HDI. Pulse set signal specifications: voltage range $9V \sim 30V$, frequency range $0 \text{ kHz} \sim 100 \text{ kHz}$.

The relationship between the input pulse frequency of HDI terminal and the corresponding setting is set through F5-28~F5-31, and 100.0% of the corresponding setting of pulse input refers to the percentage of the maximum frequency F0-10.

6: Multi-segment instruction

When selecting multi-segment instruction operation mode, through different state combinations of digital input X terminal, correspond to different set frequency values. Four multi-segment instruction terminals can be set, with 16 states of the 4 terminals, corresponding to any 16 "multi-segment instructions" through FA group function codes, and "multi-segment instructions" are the percentage of the maximum frequency F0-10.

7: Simple PLC

When the frequency source is simple PLC, the operating frequency of the drive can be switched between $1 \sim 16$ arbitrary frequency instructions, and the holding time of $1 \sim 16$ frequency instructions and their respective acceleration and deceleration time can also be set by the user. For details, please refer to the relevant instructions of FA group.

8: PID

Process PID control is a common method of process control. By proportional, integral and differential operation of the difference between the feedback signal of the controlled quantity and the target signal, the output frequency of the drive is adjusted to form a closed-loop system, so that the controlled quantity can be stabilized at the target value. When using PID as frequency source, it is necessary to set the related parameters of F9 group "PID function".

9: Communication setting

When the communication setting is as a frequency source, it is necessary to set the communication related parameters of Fb group.

| | | 4 | PULSE setting (HDI) | | | | |
| | | 5 | Communication setting | | | | |

When the drive runs to the upper limiting frequency, the drive keeps running at the upper limiting frequency.

| F0-12 | Upper limiting frequency | Factory value | 50.00Hz | Attribute | 0 | | |
|-------|------------------------------------|-----------------------------------|--|------------------------|-------|--|--|
| | Setting range | F0-14 (| F0-14 (lower limiting frequency) ~ F0-10 (maximum frequency) | | | | |
| F0-13 | Upper limiting frequency offset | Factory value | 0.00Hz | Attribute | 0 | | |
| | Setting range | 0.00Hz~ F0-10 (maximum frequency) | | | | | |
| F0-14 | Lower limit frequency | Factory value | 0.00Hz | Attribute | 0 | | |
| | Setting range | | 0.00Hz ~ F0-12 | (upper limiting freque | ency) | | |

Upper limiting frequency: When the set frequency of the drive is greater than the upper limiting frequency, the drive runs at the upper limiting frequency.

Upper limiting frequency offset: When the upper limiting frequency source is set to analog or HDI setting, F0-13 is used as the offset of the set value, and the offset frequency is added to the set upper limiting frequency value of F0-11 as the set value of the final upper limiting frequency.

Lower limiting frequency: When the frequency instruction is lower than the lower limiting frequency, the drive can stop, run at the lower limiting frequency or run at zero speed, which can be set by F8-14 (set frequency lower than the lower limiting frequency running mode).

| F0.1F | Carrier frequency | | Factory value | Model determination | Attribute | 0 | |
|-------|--------------------------------------|---|---------------|---------------------|-----------|---|--|
| FU-15 | Setting range | | | 0.5KHz ~ 16.0KHz | Attribute | | |
| | Carrier is adjusted with temperature | | Factory value | 1 | Attribute | 0 | |
| F0-16 | C. III . | 0 | | | | | |
| | Setting range 1 | | Yes | | | | |

When the carrier frequency is low, the higher harmonic component of the output current increases, the motor loss increases and the motor temperature rise increases; When the carrier frequency is higher, the motor loss decreases and the motor temperature rise decreases, however the drive loss increases, the drive temperature rise increases and the interference increases.

The carrier frequency is adjusted with temperature, which means that when the drive detects that its radiator temperature is high, it automatically reduces the carrier frequency to reduce the temperature rise of the drive. When the radiator temperature is low, the carrier frequency gradually returns to the set value. This function can reduce the possibility of overheating alarm of the drive.

When the command source is bound to a frequency source, the frequency source set by F0-03~F0-07 will no longer be valid during the validity of the command source. When the command source is switched, the frequency source is also switched with the bound frequency source.

| | Motor selection | | Factory value | 0 | 0 Attribute 🛛 🔊 | | |
|-------|-----------------|---|---------------|---------|-----------------|--|--|
| F0-27 | | 0 | | Motor 1 | 1 | | |
| | Setting range | 1 | Motor 2 | | | | |

The drive supports the application of two motors by time-sharing, and you can set the nameplate parameters of the motors, tune the independent parameters, select different control modes and independently set the parameters related to the running performance for the two motors.

Motor parameter 1 corresponds to functional parameter groups F2 and F3, and motor parameter 2 corresponds to functional parameter group A5.

The user can select the current motor parameter group through this parameter, and can also switch the motor parameters through the digital input terminal X. When the motor selection function is selected for the X terminal function, the set value of this parameter will be invalid, and the X terminal selection shall prevail.

| | Parameter initializati | on | Factory value | 0 | Attribute | ۲ |

| | | Restore user parameters | | | | |

1. Clear record information

Clear the fault record information, cumulative running time, cumulative power-on time and cumulative power consumption of drive.

2. Restore the factory set value, excluding motor parameters

Most of the functional parameters of the drive are restored to the factory parameters, but the motor

parameters, fault record information, cumulative running time, cumulative power-on time and cumulative power consumption are not restored.

4. Back up the user's current parameters

Back up the parameters set by the current user. Back up the values set for all current function parameters. In order to facilitate customers to recover after parameter adjustment disorder.

5. Restore the user backup parameters

Restore the user parameters backed up before, that is, restore the parameters backed up by setting F0-28 to 4.

12.2 F1 group start-stop control

| | Startup mode | | Factory value | 0 | Attribute | 0 | | |
|-------|---------------------------|-----------------|----------------------------|-------------------------------|-----------|---|--|--|
| | Setting range 0 2 3 | 0 | C | Direct startup | | | | |
| F1-00 | | 1 | Speed tracking and restart | | | | | |
| | | 2 | Pre-excitation sta | start (AC asynchronous motor) | | | | |
| | | SVC quick start | | | | | | |

0: direct startup

If the starting time of DC braking is set to 0, the drive starts to run from the starting frequency; If the starting time of DC braking is not 0, DC braking is performed first, and then the operation starts from the starting frequency. It is suitable for occasions with small inertia load and where the motor may run when starting.

1: Speed tracking and restart

The drive first judges the speed and direction of the motor, and then starts with the tracked motor frequency, so as to start the rotating motor smoothly without impact. It is suitable for instantaneous power failure and restart under large inertia load. In order to ensure the performance of speed tracking and restart, it is necessary to set the F2 group parameters of the motor accurately.

2. Pre-excitation start of asynchronous machine

Effective only for asynchronous motors, used to establish magnetic field before the motor runs. Preexcitation current and pre-excitation time are described in function codes F1-05 and F1-06.

If the pre-excitation time is set to 0, the drive cancels the pre-excitation process and starts from the starting frequency; If the pre-excitation time is not 0, pre-excitation is performed before startup, which can improve the dynamic response of the motor.

3: SVC quick start

It is only suitable for SVC control mode, which can shorten the acceleration time and is suitable for occasions where the inertia of the system is large and quick start is required, however there will be current shock.

| | Speed tracking mode | Factory value | 0 | Attribute | 0 | |
|-------|----------------------|---------------|-----------------------------------|---------------------------|------|--|
| F1 01 | | 0 | Starting from the stop frequency | | | |
| F1-01 | Setting range | 1 | Starting from the power frequency | | | |
| | | 2 | Startin | g from the maximum freque | ency | |
| F1 00 | Speed tracking speed | Factory value | y value 20 Attribute | | | |
| F1-02 | Setting range | | 1 | ~100 | | |

Speed tracking mode:

0: Track down from the frequency when power outage of the machine, which is selected in general cases.

1: It is used when the power frequency is switched to frequency conversion, and it is used when restarting after power outage for a long time.

2: Track down from the maximum frequency, which is applied to generating load generally.

Speed tracking speed:

The larger the parameter, the faster the tracking speed, but too large a setting may cause the tracking effect to be unreliable.

| F1 02 | Starting frequency | Factory value | 0.00Hz | 0.00Hz Attribute | |
|-------|------------------------------------|---------------|---------------|------------------|---|
| F1-03 | Setting range | 0 | .00Hz ~ 50.00 | Hz | |
| F1 04 | Holding time of starting frequency | Factory value | 0.0s | Attribute | ۲ |
| F1-04 | Setting range | | 0.0s ~ 100.0s | 5 | |

In order to ensure the motor torque when startup, please set an appropriate starting frequency. In order to fully establish the magnetic flux when the motor is started, it is necessary to keep the starting frequency for a certain time. The starting frequency is not limited by the lower limiting frequency. However, when the set target frequency is less than the starting frequency, the drive is not started and is in a standby state. In the process of forward and reverse switching, the holding time of starting frequency will not work.

| F1 OF | Starting DC and pre-excitation current | | Factory value | 50% | Attribute | 0 |

| F1-07 | Setting range | g range 1 | | | | |
| | | 2 | Dynamic S curve | | | |

Starting DC braking, which is generally used to stop the running motor before starting; Pre-excitation is used to make asynchronous motor establish magnetic field before starting, so as to improve response speed.

Starting DC braking is only effective when the starting mode is direct starting. At this time, the drive will perform DC braking according to the set starting DC braking current, and then start running after the starting DC braking time. If the DC braking time is set to 0, it will be started directly without DC braking. The greater the DC braking current, the greater the braking force.

If the startup mode is pre-excitation startup of asynchronous machine, the drive first establishes the magnetic field in advance according to the set pre-excitation current, and then starts running after the set pre-excitation time. If the pre-excitation time is set to 0, it will be started directly without pre-excitation process.

Starting DC braking current/pre-excitation current has two situations relative to the base value.

- 1. When the rated current of the motor is less than or equal to 80% of the rated current of the drive, it is a percentage base value relative to the rated current of the motor.
- 2. When the rated current of the motor is greater than 80% of the rated current of the drive, it is a percentage base value relative to 80% of the rated current of the drive.

Acceleration and deceleration mode:

0: linear acceleration and deceleration

The output frequency increases or decreases in a linear manner.

1: Static S curve

When the target frequency is fixed, the output frequency increases or decreases according to the S curve. It is suitable for use in places that require gentle start or stop, such as elevators and conveyor belts.

2: Dynamic S curve

When the target frequency changes dynamically in real time, the output frequency increases or decreases in real time according to the S curve. It is suitable for occasions with high comfort requirements and quick real-time response.

| E1 09 | Time proportion at the beginning of S curve | Factory value | 30.0% | Attribute | 0 |
|-------|---|-----------------------|------------|-----------|---|
| F1-08 | Setting range | 0.0% | ~ (100.0%- | F1-09) | |

| | C. III | 0 | Stop | op by deceleration | | |
| | Setting range | 1 | | Free sto | р | |

0: Stop by deceleration After the stop command takes effect, the drive reduces the output frequency according to the deceleration time, and stops after the frequency drops to 0.

1: Free stop After the stop command takes effect, the drive immediately terminates the output, and the motor stops freely according to the mechanical inertia.

| F1 11 | Starting frequency of stop DC braking | Factory value | 0.00Hz | Attribute | 0 | |
|-------|---------------------------------------|---------------------------|---------------|-----------|---|--|
| F1-11 | Setting range | 0.00Hz~ maximum frequency | | | | |
| F1 10 | Waiting time for stop DC braking | Factory value | 0.0s | Attribute | 0 | |
| FI-IZ | Setting range | 0.0s ~ 100.0s | | | | |
| F1 10 | Stop DC braking current | Factory value | 50% | Attribute | 0 | |
| F1-13 | Setting range | | 0% ~ 100% | | | |
| F1 14 | Stop DC braking time | Factory value | 0.0s | Attribute | 0 | |
| F1-14 | Setting range | | 0.0s ~ 100.0s | s | | |

Starting frequency of stop DC braking: In the process of stop by deceleration, when the operating frequency is reduced to this frequency, the DC braking process is started.

Waiting time of stop DC braking: After the operating frequency is reduced to the starting frequency of DC braking, the drive stops outputting for a period of time before starting DC braking. It is used to prevent overcurrent and other faults that may be caused by starting DC braking at higher speed.

Stop DC braking current: Stop DC braking current has two situations relative to the basic value.

- 1. When the rated current of the motor is less than or equal to 80% of the rated current of the drive, it is a percentage base value relative to the rated current of the motor.
- 2. When the rated current of the motor is greater than 80% of the rated current of the drive, it is a percentage base value relative to 80% of the rated current of the drive.

Stop DC braking time: Time for DC braking amount to be maintained. If this value is 0, the DC braking process is cancelled.

| F1-15 | Brake utilization rate | Factory value | 100% | Attribute | 0 |
|-------|------------------------|---------------|-----------|-----------|---|
| FI-15 | Setting range | | 0% ~ 100% | | |

Only valid for drives with built-in braking units. It is used to adjust the duty cycle of the moving unit. If the braking utilization rate is high, the braking unit will have a high action duty cycle and a strong braking effect, but the bus voltage of the drive fluctuates greatly during braking.

12.3 F2 group motor parameters

| | Motor type | | Factory value | 0 | Attribute | 0 | |
|-------|------------------------|------|--------------------------------------|---------------------------|-----------|---|--|

| | Setting range | 0.01mH ~ | 0.01mH ~ 655.35mH (drive power >55kW) | | | |
| | No-load current of asynchronous motor | Factory value | Tuning parameter | Attribute | 0 | |
| F2-10 | Cottine reason | 0.01A~F2-03 (drive power ≤ 55kW) | | | | |
| | Setting range | 0.1A~F2-03 (drive power >55kW) | | | | |

The above are the tuning parameters of asynchronous motor, which are generally not on the nameplate of the motor and need to be obtained by automatic tuning of the drive. Where, only three parameters F2-06 ~F2-08 can be obtained by "parameter tuning of static part of asynchronous motor", while all the above parameters can be obtained by "dynamic complete tuning of asynchronous motor" and "static complete tuning of asynchronous motor".

When changing the rated power or voltage of the motor, the drive will automatically modify the above parameters and restore them to the default parameters of the commonly used standard motor.

| Tuning selection | | | Factory value | 0 | Attribute | 0 | | |
|------------------|---------------|--|---|---|-----------|---|--|--|
| F2-37 | 0 | No operation | No operation | | | | | |
| | 1 | Static part parameter tuning of asynchronous machine | | | | | | |
| | Setting range | 2 | Dynamic complete tuning of asynchronous machine | | | | | |
| | | 3 | Static complete tuning of asynchronous machine | | | | | |

Before parameter self-learning, motor type and nameplate parameters F2-00~F2-05 shall be set correctly, and encoder type (Fd-01) and pulse number (Fd-00) shall be set additionally for closed-loop vector control.

Description of tuning action: Set the nameplate parameters and self-learning type of the motor, and then press the RUN key to tune the drive.

0: No operation:

i.e., tuning is disabled.

1: Static part parameter tuning of asynchronous machine

It is suitable for the occasions where synchronous motors are used and the large inertia load is not easy to be disengaged, causing failure of rotary tuning.

2: Dynamic complete tuning of asynchronous machine

In the process of dynamic tuning, the drive performs static tuning first, and then accelerates to 80% of the rated frequency of the motor according to the acceleration time. After maintaining for a period of time, it stops by deceleration according to the deceleration time and ends the tuning.

3: Static complete tuning of asynchronous machine

It is suitable for self-learning of motor parameters when the motor is in static state without encoder (at this time, the motor may still have slight jitter, so pay attention to safety)

12.4 F3 group vector control parameters

| F3-00 | Speed/Torque control selection | | Factory value | 0 | Attribute | 0 | |
|-------|--------------------------------|---|----------------|---|-----------|---|--|
| | C. III . | 0 | Speed control | | | | |
| | Setting range | 1 | Torque control | | | | |

Speed control/Torque control switching (Xx function selection 46). These two terminals shall be used together with F3-00 to realize the switching of speed and torque control. When the speed control/torque control switching terminal is invalid, it is the control mode selected by F3-00; If the speed control/torque control switch is valid, it is the control mode not selected by F3-00.

When the torque control prohibited terminal (Xx function selection 29) is valid, the drive is fixed as the speed control mode.

| F2 01 | Speed loop proportional gain 1 | Factory value | 30 | Attribute | 0 |
|-------|--------------------------------|---------------|----------------|-----------|---|
| F3-01 | Setting range | | 1 ~ 100 | | |
| F2 02 | Speed loop integration time 1 | Factory value | 0.50s | Attribute | 0 |
| F3-02 | Setting range | | 0.01s ~ 10.00s | 5 | |
| F2 02 | Switching frequency 1 | Factory value | 5.00Hz | Attribute | 0 |
| +3-03 | Setting range | | 0.00Hz ~ F3-06 | 6 | |
| F2 04 | Speed loop proportional gain 2 | Factory value | 20 | Attribute | 0 |
| F3-04 | Setting range | | 1 ~ 100 | | |
| F2 0F | Speed loop integration time 2 | Factory value | 1.00s | Attribute | 0 |
| F3-05 | Setting range | | 0.01s ~ 10.00s | 5 | |
| F2.0C | Switching frequency 2 | Factory value | 10.00Hz | Attribute | 0 |
| F3-06 | Setting range | F3-03 | ~ maximum fre | equency | |

By setting the proportional gain and integration time of the speed loop, the speed dynamic response characteristics of vector control can be adjusted. Increasing proportional gain and reducing integration time can speed up the dynamic response of speed loop. However, too large proportional gain or too short integration time may cause system oscillation.

In the vector control mode, the corresponding speed loop PI parameters can be selected according to the operating frequency. When the operating frequency is less than or equal to the switching frequency 1, the speed loop selects the first group of PI parameters (proportional gain 1 and integration time 1); When the operating frequency is greater than or equal to switching frequency 2, the speed loop selects the second group of PI parameters (proportional gain 2); When the operating frequency is between switching frequency 1 and switching frequency 2, the parameter is the result of linear conversion of two groups of parameters, as shown in the following figure:

| F2 07 | Vector control slip gain | Factory value | 100% | Attribute | 0 |
|-------|--------------------------|---------------|------------|-----------|---|
| F3-07 | Setting range | | 50% ~ 200% | | |

Sensorless vector control mode, this parameter is used to adjust the steady-state accuracy of the motor: When the on-load speed of the motor is low, this parameter will be increased, otherwise it will be reduced; Flux sensor vector control mode, this parameter can adjust the output current of the drive under the same load.

| F3-08 | SVC speed feedback filtering time | Factory value | 0.015s | Attribute | 0 |
|-------|-----------------------------------|---------------|---------------|-----------|---|
| | Setting range | 0 | .000s ~ 0.100 | 10s | |

This parameter is only valid in SVC control mode. Increasing parameters can improve the stability of the motor, but with slow dynamic response; Reducing parameters can lead to fast dynamic response, but it may cause motor oscillation.

| | Upper limit source of torque in spe | ed control | Factory value | 0 | Attribute | 0 | | |

| | | 4 | HDI pulse | | | | | |
| | | 5 | Communication setting | | | | | |
| | | 6 | MIN(AI1,AI2) | | | | | |
| | | 7 | MAX(AI1,AI2) | | | | | |
| F2 11 | Digital setting of upper limit of | torque | Factory value | 150.0% | Attribute | 0 | | |
| 13-11 | Setting range | Setting range | | 0.0% ~ 200.0% | | | | |

| | Upper limit source of torque in spe mode (power generation | ed control) | Factory value | 0 | Attribute | 0 | | |
|-------|---|-----------------|-----------------------|--|------------|---|--|--|
| | | 0 | F3-10 setting (no | F3-10 setting (no distinction between motoring and | | | | |
| | | | | power generat | 1011) | | | |
| | | 1 | Al1 | | | | | |
| 52.42 | F3-12 Setting range | 2 | AI2 | | | | | |
| F3-12 | | 3 | | | | | | |
| | Setting range | 4 | HDI pulse | | | | | |
| | | 5 | Communication setting | | | | | |
| | | 6 | | MIN(AI1,AI2 | ?) | | | |
| | | 7 | | MAX(AI1,AI | 2) | | | |
| | | 8 | Pa | Parameter F3-13 setting | | | | |
| | Digital setting of upper limit of | torque | E de la la | 150.00/ | ALC: N. L. | | | |
| F3-13 | (power generation) | | Factory Value | 150.0% | Attribute | 0 | | |
| | Setting range | | | 0.0% ~ 200.0 | 1% | | | |

The above parameters are used to set the upper limit value of output torque in vector control speed mode. The upper limit of torque can be set by digital setting, Alx analog, HDI pulse and communication. When set by Al analog, HDI pulse and communication, it 100% corresponds to F3-11, and F3-11 100% corresponds to the rated output current of the drive.

Example: When F3-10 = 1, the upper limit source of torque is Al1; F3-11=150.0%. When Al1 inputs 50%, the upper limit of the set torque at this time is $50\% \times 150.0\% = 75.0\%$ of the rated current.

Torque limit is divided into motoring state and power generation state. In the motoring state, the upper limit of torque is determined by F3-10 and F3-11; In the power generation state, the upper limit of torque is determined by F3-12 and F3-12 is set to 0, no distinction is made between motoring and power generation, and the upper limit of torque is determined by F3-10 and F3-11.

| E2 14 | Excitation regulation proportional gain | Factory value | 2000 | Attribute | 0 | |
|-------|---|---------------|-----------|-----------|---|--|
| F3-14 | Setting range | 0 ~ 60000 | | | | |
| FD 1F | Excitation regulation integral gain | Factory value | 1300 | Attribute | 0 | |
| F3-15 | Setting range | 0 ~ 60000 | | | | |
| 52.46 | Torque regulation proportional gain | Factory value | 2000 | Attribute | 0 | |
| F3-16 | Setting range | | 0 ~ 60000 |) | | |
| F2 17 | Torque regulation integral gain | Factory value | 1300 | Attribute | 0 | |
| F3-1/ | Setting range | | 0 ~ 60000 | | | |

Current loop PI adjustment parameters in vector control mode: such parameters will be automatically obtained after asynchronous machine tuning, which generally do not need to be modified. Note: The integral regulator of the current loop does not use the integration time as the dimension, but directly sets the integration gain.

If the PI gain of the current loop is set too large, it may cause the whole control loop to oscillate, so when the current oscillation or torque fluctuation is large, the PI proportional gain or integral gain here can be reduced manually.

| | Power generation limit ena | | Factory value | 0 | Attribute | 0 | | | |
|---------------------|--------------------------------|---|---------------|---------------------|-----------|---|--|--|--|
| F3-23 Setting range | | 0 | | Invalid | | | | | |
| | Setting range 1 | 1 | Valid | | | | | | |
| 52.24 | Upper limit of power generatio | | Factory value | Model determination | Attribute | 0 | | | |
| F3-24 | 4 Setting range | | 0.0% ~ 200.0% | | | | | | |

In the vector control speed mode, the power limiting function can effectively reduce the bus voltage overshoot during motor braking and avoid the occurrence of overvoltage fault. The upper limit of power generation F3-24 is the percentage of the rated power of the motor. When overvoltage still occurs after the power generation limit function is enabled, please adjust F3-24 downward.

The part above F3 group parameters are related parameters of vector speed mode, and those below are related parameters of vector torque mode.

| | Upper limit source of torque in torque | e control | Factory value | 0 | Attribute | 0 | |
|---------------------|--|-----------|-----------------------|----------------|-----------|---|--|
| | | 0 | Digi | tal setting (F | 3-27) | | |
| | | 1 | | | | | |
| | | 2 | AI2 | | | | |
| F3-25 Setting range | 3 | AI3 | | | | | |
| | Setting range | 4 | HDI pulse | | | | |
| | | 5 | Communication setting | | | | |
| | | 6 | MIN(AI1,AI2) | | | | |
| | | 7 | | MAX(AI1,AI2 | 2) | | |
| F2 27 | Upper limit of torque in torque co | | Factory value | 150.0% | Attribute | 0 | |
| F3-27 Setting range | | | -2 | 00.0% ~ 200 | .0% | | |

Torque setting adopts relative value, 100.0% corresponding to the rated torque of the motor. The setting range is -200.0%~200.0%, indicating that the maximum torque of the drive is twice the rated torque of the drive. When the torque is set as positive, the drive runs forward; When the torque is set as negative, the drive runs in reverse.

| F3_29 | Maximum forward frequency of torque control | Factory value | 50.00Hz | Attribute | 0 |
|-------|---|--------------------------|---------|-----------|---|
| F3-29 | Setting range | 0.00 ~ maximum frequency | | | |
| 52.20 | Maximum reverse frequency of torque control | Factory value | 50.00Hz | Attribute | 0 |
| F3-30 | Setting range | 0.00 ~ maximum frequency | | | |

When the drive torque is controlled, if the load torque is less than the output torque of motor, the motor speed will continue to rise. In order to prevent accidents such as runaway in the mechanical system, the maximum speed of motor during torque control must be limited. During torque control, the acceleration and deceleration time of the upper frequency limit is set in F8-07 (acceleration time 4)/F8-08 (deceleration time 4), which is 0.0s by default. It is used to set the forward or reverse maximum operating frequency of the drive under torque control mode. If a dynamic and continuous change in the maximum frequency of torque control is required, it can be achieved by controlling the upper limiting frequency.

| F3-31 | Filtering time for torque rise | Factory value | 0.00s | Attribute | 0 |
|-------|--------------------------------|-----------------|---------------|-----------|---|
| | Setting range | (| 0.00s ~ 650.0 | l0s | |
| 52.22 | Filtering time for torque drop | Factory value | 0.00s | Attribute | 0 |
| F3-32 | Setting range | 0.00s ~ 650.00s | | 10s | |

In the torque control mode, the difference between the motor output torque and the load torque determines the speed change rate of the motor and the load, therefore, the motor speed may change rapidly, causing problems such as excessive noise or mechanical stress. By setting the torque control acceleration and deceleration time, the motor speed can be changed smoothly.

For example, two motors are hard-wired to drive the same load. In order to ensure the uniform distribution of the load, one drive is set as the master in speed control mode, while the other drive is set as the slave in torque control mode. The actual output torque of the master is used as the torque instruction of the slave. At this time, the torque of the slave needs to follow the master quickly, so the acceleration and deceleration time of the slave's torque control is 0.00 s.

12.5 F4 group VF control parameters

| VF curve settir |] | Factory value | 0 | Attribute | ۲ | | |
|---------------------|---------------|---------------|-----------------------------|-----------|---|--|--|
| F4-00 Setting range | 0 | | Linear V | /F | | | |
| | 1 | М | Multipoint V/F | | | | |
| | Setting range | 2~9 | Reserved | | | | |
| | | 10 | VF complete separation mode | | | | |
| | | 11 | VF semi-separation mode | | | | |

0: Linear V/F

It is suitable for ordinary constant torque load.

1: multipoint V/F

It is suitable for special loads such as dehydrators and centrifuges. At this time, by setting F4-03 \sim F4-08 parameters, any V/F curve can be obtained.

10: VF complete separation mode

At this time, the output frequency and output voltage of the drive are independent of each other, and the output frequency is determined by the frequency source, while the output voltage is determined by F4-13 (VF separated voltage source). V/F complete separation mode is generally used in occasions such as induction heating, drive power supply and torque motor control.

11: VF semi-separation mode

In this case, V and F are proportional, but the proportional relationship can be set by the voltage source F4-13, and the relationship between V and F is also related to the rated voltage and rated frequency of the motor in F2 group. Assuming that the input of the voltage source is X (X is a value of 0~100%), the relationship between the output voltage V of the drive and the frequency F is: $V/F = 2^*X^*$ (rated voltage of the motor)/ (rated frequency of the motor)

| | Torque boost | Factory value | Model determination | Attribute | 0 | | |
|-------|---|-------------------------------|---------------------------------|-----------|---|--|--|
| F4-01 | Cotting range | 0.0% (automatic torque boost) | | | | | |
| | Setting range | 0.1% ~ 30.0% | | | | | |
| 54.00 | Torque boost cutoff frequency | | Factory value 50.00Hz Attribute | | | | |
| F4-02 | 02 Setting range 0.00Hz ~ maximum frequency | | | | | | |

Torque boost is used to compensate the low-frequency torque characteristics of V/F control. If the torque boost setting is too large, it will easily lead to overcurrent or overload failure, and the motor will easily overheat; If the torque boost setting is too small, it will easily lead to motor stall, therefore the torque boost parameters need to be adjusted according to the actual load situation.

When the torque boost is set to 0.0%, the drive will automatically calculate the required torque boost value according to the parameters such as motor stator resistance. In this case, if conditions permit, please tune the parameters of the motor to obtain accurate motor parameters.

Torque boost torque cutoff frequency: At this frequency, the torque boost amount is calculated linearly according to the operating frequency and cutoff frequency, and if this set frequency is exceeded, the torque boost will not work, as shown in the following figure:

| E4 02 | Multipoint VF frequency point F1 | Factory value | 0.00Hz | Attribute | ۲ | | |
|---------------------|----------------------------------|---------------|----------------|------------|---|--|--|
| F4-03 | Setting range | | 0.00 Hz ~ F4.0 |)5 | | | |
| E4.04 | Multipoint VF voltage point V1 | Factory value | 0.0% | Attribute | 8 | | |
| F4-04 | Setting range | 0.0% ~ 100.0% | | | | | |
| F4.0F | Multipoint VF frequency point F2 | Factory value | 0.00Hz | Attribute | 8 | | |
| F4-05 Setting range | | F4-03 ~ F4-07 | | | | | |
| F4.00 | Multipoint VF voltage point V2 | Factory value | 0.0% | Attribute | ۲ | | |
| F4-06 | Setting range | 0.0% ~ 100.0% | | | | | |
| F4 07 | Multipoint VF frequency point F3 | Factory value | 0.00Hz | Attribute | ۲ | | |
| F4-07 | Setting range | F4-05 ~r | ated frequenc | y of motor | | | |
| F4 00 | Multipoint VF voltage point V3 | Factory value | 0.0% | Attribute | 0 | | |
| F4-08 | Setting range | | 0.0% ~ 100.09 | % | | | |

The curve of multipoint V/F shall be set according to the load characteristics of the motor. It shall be noted that the relationship between three voltage points and frequency points must meet the following requirement: V1 < V2 < V3, F1 < F2 < F3. If the voltage is set too high at low frequency, it may cause overheating or even burn out of the motor, or overcurrent or overcurrent protection of the drive.

| VF slip compensation gain | VF slip compensation gain | Factory value | 0.0% | Attribute | 0 |
|---------------------------|---------------------------|---------------|-------------|-----------|---|
| F4-09 | Setting range | | 0% ~ 200.09 | % | |

VF slip compensation can compensate the motor speed deviation of asynchronous motor generated when the load increases, so that the motor speed can basically remain stable when the load changes.

The VF slip compensation gain is set to 100.0%, which means that the slip compensated when the motor is loaded with rated load is the rated slip of the motor, while the rated slip of the motor is obtained through automatic calculation of rated frequency and rated speed of motor.

When adjusting the VF slip compensation gain, the principle is that the motor speed is basically the same as the target speed generally under rated load. When the motor speed is different from the target value, it is necessary to fine-tune the gain.

| 54.10 | VF overexcitation gain | Factory value | 64 | Attribute | 0 |
|-------|------------------------|---------------|---------|-----------|---|
| F4-10 | Setting range | | 0 ~ 200 | | |

In the process of drive deceleration, over-excitation control can suppress the rise of bus voltage and avoid overvoltage fault. The greater the over-excitation gain, the stronger the suppression effect.

It is necessary to improve the over-excitation gain when the drive is prone to overvoltage alarm during deceleration. However, the over-excitation gain is too large, which will easily lead to the increase of output current and the motor heating.

When the inertia is very small, and the voltage will not rise during the motor deceleration, it is suggested to set the over-excitation gain to 0; In the case of braking resistor, it is also recommended that the over-excitation gain be set to 0.

| E4 11 | VF oscillation suppression gain | Factory value | 40 | Attribute | 0 |
|-------|---------------------------------|---------------|---------|-----------|---|
| F4-11 | Setting range | | 0 ~ 100 | | |

In VF control mode, if the motor oscillates obviously, the gain can be increased appropriately. The greater the gain, the more obvious the suppression of oscillation will be. Try to set it as small as possible under the premise of effectively suppressing oscillation, so as not to adversely affect VF operation. When the motor has no oscillation, please set this gain to 0.

When using the oscillation suppression function, the rated current and no-load current parameters of the motor are required to be accurate, otherwise the VF oscillation suppression effect is not good.

| | Voltage source of VF separation | n | Factory value | 0 | Attribute | 0 | |
|----------|-------------------------------------|-------|-----------------------------|----|-----------|---|--|
| F4-13 Se | | 0 | Digital setting (F4-14) | | | | |
| | | 1 | Al1 | | | | |
| | | 2 | AI2 | | | | |
| | | 3 | AI3 | | | | |
| | Setting range | 4 | Pulse setting HDI | | | | |
| | | 5 | Multi-segment instruction | | | | |
| | | 6 | Simple PLC | | | | |
| | | 7 | PID | | | | |
| | | 8 | Communication setting | | | | |
| F4 14 | Voltage digital setting of VF separ | ation | Factory value | 0V | Attribute | 0 | |
| F4-14 | Setting range | | 0v ~ Rated voltage of motor | | | | |

VF separation is generally used in occasions such as induction heating, drive power supply and torque motor control.

When selecting VF separation control, the output voltage can be set by function code F4-14, or it can come from analog, pulse setting HDI, multi-segment instruction, simple PLC, PID or communication setting. When non-digital setting is used, 100% of each setting corresponds to the rated voltage of the motor. When the percentage of output setting such as analog is negative, the set absolute value is taken as the effective setting value.

0: Digital setting

The voltage is directly set by F4-14.

1: Ai1

2: Ai2

3: Ai3

The voltage is determined by the analog input terminal.

4. Pulse setting HDI

Voltage setting is given by terminal pulse. Pulse set signal specifications: voltage range 9V \sim 30V, frequency range 0 kHz \sim 100 kHz.

5. Multi-segment instruction

When the voltage source is multi-segment instruction, FA group parameters shall be set to determine the set voltage. The 100.0% given by the multi-segment instruction of FA group parameters refers to the percentage relative to the rated voltage of the motor.

6. Simple PLC

When the voltage source is simple PLC, FA group parameters need to be set to determine the set output voltage.

7. PID

Output voltage is generated according to PID closed loop. See the introduction of F9 group PID for details. 8. Communication setting

It refers to the voltage set by the upper computer through communication.

VF separation voltage source selection is similar to frequency source selection. See the introduction of F0-03 main frequency source selection. Where, 100.0% of the corresponding settings for various selections refers to the rated voltage of the motor (taking the absolute value of the corresponding settings).

| F4 1F | Voltage rise time of VF separation | Factory value 0.0s | | Attribute | 0 |
|-------|------------------------------------|--------------------|------------|---|---|
| F4-15 | Setting range | | .0s ~ 1000 | 0.0s Attribute ~ 1000.0s 0.0s 0.0s Attribute ~ 1000.0s 0.0s | |
| F4-16 | Voltage drop time of VF separation | Factory value | 0.0s | Attribute | 0 |
| | Setting range | 0.0s ~ 1000.0s | | | |

Same as the frequency acceleration and deceleration time, the voltage rise (drop) time refers to the time required to accelerate (decelerate) from zero voltage (motor rated voltage) to the motor rated voltage (zero voltage), not the time to accelerate (decelerate) from zero voltage (target voltage) to the target voltage (zero voltage).

| | Selection of VF separation sto | Factory value | 0 | Attribute | 0 | | |
|-------|--------------------------------|---------------|---|-----------|---|--|--|
| F4-17 | C. III | 0 | 0: Frequency/voltage separately decreases to 0 | | | | |
| | Setting range | 1 | 1: Frequency decreases again after the voltage decreases to (| | | | |

0: Frequency/voltage separately decreases to 0

When the drive stops, the frequency and voltage decrease according to their respective acceleration and deceleration times.

1: Frequency decreases again after the voltage decreases to 0

The output voltage is first reduced to 0V according to the voltage drop time, and then the frequency is reduced to 0Hz according to the deceleration time

| F4-18 | Overcurrent stall action current | | Factory value | 150% | Attribute | |
|-------|--|---------|----------------------|----------|---------------------|---|
| | Setting range | | 50% ~ 200.0% | | | |
| 54.10 | Overcurrent stall enabled | | Factory value | 1 | Attribute | ۲ |
| F4-19 | F4-19 Setting range | 0 | Invalid | | | |
| | Setting range | 1 | | Valid | d d Attribute | |
| F4-20 | Overcurrent stall suppression gain | | Factory 20 Attribute | | Attribute | 0 |
| | Setting range | 0 ~ 100 | | | | |
| F4-21 | Current compensation coefficient of doub overcurrent stall action | e-speed | Factory 50% A | | Attribute | 8 |
| | Setting range | | | 50% ~ 20 | 0% | |

Overcurrent stall enabled:

Overcurrent stall action current:

Overcurrent stall enable function: When the output current of the drive reaches the overcurrent stall action current, the drive starts to adjust the output frequency. If it is in the motoring state at this time, the output frequency will start to drop and adjust; If it is in the power generation state, the output frequency will start to rise and adjust. In this case, the acceleration and deceleration time will be automatically lengthened. If the actual acceleration and deceleration time cannot meet the requirements, the overcurrent stall action current can be appropriately increased.

Overcurrent stall suppression gain:

When the overcurrent stall occurs, the drive adjusts the output frequency to PI, and the P proportional gain and integration time are uniformly adjusted by the overcurrent stall suppression gain parameter.

Current compensation coefficient of double-speed overcurrent stall action:

In the high frequency region, the motor drive current is small, and the speed of the motor drops greatly compared with the same stall current at the rated frequency. In order to improve the operating characteristics of the motor, the stall action current above the rated frequency can be reduced. This method has a good effect on the acceleration performance in some occasions where there are centrifuges with high operating frequency, which require several times of flux weakening and large load inertia. Overcurrent stall action current exceeding rated frequency = (fs/fn) * k * LimitCur; where, fs is the operating frequency, fn is the rated frequency of the motor, k is F4-21 "compensation coefficient of double overcurrent stall action current", and LimitCur is F4-18 "overcurrent stall action current".

When F4-21 is set to 50%, it means that the compensation coefficient of double overcurrent stall action does not work.

| the stall suppression | in deceleration | nower generation state |
|-----------------------|-----------------|------------------------|
| the stan suppression | in deceleration | power generation state |

| F4-22 | Overvoltage stall acti | on voltage | Factory value | Model determination | Attribute | 0 |

| F4-22 | Setting rang | le | | 380V model: 650.0V~800. 220V model: 320.0V~800. | n Attribute 00.0V 00.0V Attribute 4 Attribute 4 Attribute 4 | |
| 54.00 | Overvoltage stall | enabled | Factory value | 1 | Attribute | |
| F4-23 | C. III | 0 | Invalid | | | |
| | Setting range | 1 | | Valid | | _ |
| F4-24 | Overvoltage stall suppres gain | sion frequency | Factory value | 30 | Attribute | 0 |
| | Setting rang | je | | 0 ~ 100 | ~ 100 | |
| F4-25 | Overvoltage stall suppress | ion voltage gain | Factory value | 30 | Attribute | 0 |
| | Setting rang | je | | 0 ~ 100 | | |
| F4-26 | Maximum rise frequency stall | of overvoltage | Factory value | 5Hz | Attribute | |
| | Setting rang | le | | 0 ~ 50Hz | | |

When the bus voltage reaches the set value of overvoltage stall action voltage, the actual motor speed is greater than the motor speed corresponding to the output frequency of the drive, and the motor is in a power generation state. In order to protect the system safety and avoid tripping protection, the drive starts the overvoltage stall protection function and increases the output frequency, so the actual deceleration time will be automatically lengthened. If the actual deceleration time cannot meet the system requirements, the over-excitation gain can be appropriately increased or addition braking resistor can be installed.

During the overvoltage stall action, the drive simultaneously adjusts the output frequency and output voltage through PI control, and the overvoltage stall suppression frequency gain is used to modify the proportional gain and integration time of the frequency adjustment PI; Overvoltage stall suppression voltage gain is used to modify the proportional gain and integration time of voltage adjustment PI.

The maximum rise frequency of overvoltage stall is used to limit the maximum rise frequency during frequency adjustment.

Note: The bus voltage limit function in vector control mode also needs to turn on F4-23 overvoltage stall enable function and set F4-22 limit voltage point.

12.6 F5 group input terminal

NVF7 Series Drive comes standard with five multi-function digital input terminals (where HDI can be used as high-speed pulse input terminal) and 2 analog input terminals. The following functions can be set for each input terminal.

| Set value | Function | Notes |
|-----------|---|--|
| 0 | No function | Unused terminals can be set to "no function" to prevent misoperation. |
| 1 | Forward running FWD | The forward rotation and reverse rotation of the drive are controlled by |
| 2 | Reverse running REV | external terminals. |
| 3 | Three-wire running control | It is used for the running control in control terminal mode. Refer to the description of function code F5-11 ("terminal command mode"). |
| 4 | Forward jog | It is used for jog running control in control terminal mode, and the jog |
| 5 | Reverse jog | operating frequency and acceleration and deceleration time are defined in F8-00 ~ F8-02. |
| 6 | Terminal UP | When the frequency source is set to digital setting and the frequency is |
| 7 | Terminal DOWN | modified, it is used as an increasing and decreasing instruction. |
| 8 | Free stop | Free running stop is realized by control terminal, which has the same function as defined in F1-10. |
| 9 | Fault reset | The terminal is used for fault reset function. Same as the fault reset function of the STOP key on the keyboard, this function can realize remote fault reset. |
| 10 | Running pause | When the drive stops by deceleration, all operating parameters are memorized (such as PLC parameters and PID parameters) when the terminal is valid; After the terminal is invalid, the drive will resume its previously memorized running state. |
| 11 | External fault normally on input | Through this terminal, the fault signal of external equipment can be input, which is convenient for the drive to monitor the fault of external equipment. After receiving the fault signal of external equipment, the drive displays "E.EF", that is, the external equipment fault alarm. |
| 12 | Multi-segment instruction terminal 1 | |
| 13 | Multi-segment instruction terminal 2 | 16-speed setting can be realized through 16 states of these four |
| 14 | Multi-segment instruction terminal 3 | terminals. |
| 15 | Multi-segment instruction terminal 4 | |
| 16 | Acceleration and deceleration time selection terminal 1 | Through the 4 states of this terminal, 4 types of acceleration and |
| 17 | Acceleration and deceleration time selection terminal 2 | deceleration time can be selected. |
| 18 | Frequency command switching | It is used to switch between different frequency sources. See the description of function code F0-07 for details. When it is set to switch between two frequency sources as the target frequency, frequency source switching can be realized through this terminal. |

| Set value | Function | Notes |
|-----------|---|---|
| 19 | UP/DOWN setting cleared (terminal, keyboard) | When the main frequency is set by digital setting, terminal may select this function to clear the frequency value changed by the UP and DOWN keys on the keyboard or by the multi-function terminals 6(UP) and 7(DOWN), so that the set frequency can be restored to F0-08 setting. |
| 20 | Control command switch terminal 1 | Through this terminal, the control command source can be switched from terminal control or communication control to panel control. |
| 21 | Acceleration and deceleration disabled | Maintain the current output frequency (except the stop command). |
| 22 | PID pause | The drive maintains the current output frequency and pauses PID adjustment. |
| 23 | Simple PLC state reset | Restore the drive to the initial state of simple PLC. |
| 24 | Counter input | Input terminal of counting pulse. |
| 25 | Counter reset | Clear the state of the counter. |
| 26 | Length count input | Input terminal for length counting. |
| 27 | Length reset | Clear the length. |
| 28 | Torque control disabled | The drive prohibits torque control mode and automatically enters speed control mode. |
| 29 | Pulse frequency input (valid only for HDI) | Set HDI as a high-speed pulse input terminal. |
| 30 | Reserved | Reserved. |
| 31 | Immediate DC braking | The drive directly switches to the DC braking state. |
| 32 | External fault normally off input | Through this terminal, the fault signal of external equipment can be input, which is convenient for the drive to monitor the fault of external equipment. After receiving the fault signal of external equipment, the drive displays "E.EF", that is, the external equipment fault alarm. |
| 33 | Frequency modification enabled | Through this terminal, it can be controlled whether the frequency modification of the drive is valid. When the terminal state is valid, the frequency of the drive can be modified, otherwise the frequency will not change. When this function is not set, it does not affect the setting of main frequency and auxiliary frequency. |
| 34 | PID action direction reversed | When this terminal is valid, the PID function is reversed to that set in F9-03. |
| 35 | External stop terminal 1 | Control the drive to stop properly, which is only valid under panel control. |
| 36 | Control command switch terminal 2 | It is used to switch between terminal control and communication control. |
| 37 | PID integration pause | The integral adjustment function of PID is paused. In this case, the proportional adjustment and differential adjustment are still valid, and the integral attribute of PID is required to be F9-25=x1. |
| 38 | Main frequency and preset frequency switching | When this terminal is valid, the frequency source X is replaced by the preset frequency (F0-08). |
| 39 | Auxiliary frequency and preset frequency switching | When this terminal is valid, the frequency source Y is replaced by the preset frequency (F0-08). |
| 40 | Motor selection terminal | Select motor 1 when the terminal is invalid, and motor 2 when the terminal is valid. |
| 41 | Reserved | Reserved. |
| 42 | PID parameter switching | When F9-18=1 (PID parameters are switched by X terminal) and the terminal state is 0, the PID parameters are F9-05 ~ F9-07; When the terminal state is 1, the PID parameters are F9-15~F9-17. |
| 43 | User-defined fault 1 | When user-defined fault terminals 1 and 2 are valid, the drive will alarm |
| 44 | User-defined fault 2 | E.US1 and E.US2 respectively, and the drive will handle the fault according to the parameters selected by FE-49. |

| Set value | Function | Notes |
|-----------|---|---|
| 45 | Speed control/torque control switching | It is used to switch between speed control mode and torque control mode. |
| 46 | Emergency stop | The drive is in the fastest deceleration state, at which the deceleration current and voltage are in the maximum limit state. |
| 47 | External stop terminal 2 | When the terminal state is valid, the drive enters the stop by deceleration state, and the deceleration time is deceleration time 4. It is valid in all control modes. |
| 48 | Deceleration DC braking | The drive decelerates to the starting frequency of DC braking and enters the DC braking deceleration state. |
| 49 | Current running time is cleared | Clear running time of drive: it is used for the function of timed operation (F8-42). |
| 50 | Two-wire/three-wire switching | It is used to switch between two-wire control method and three-wire control method (that is, two-wire 1 is switched to three-wire 1, and two-wire 2 is switched to three-wire 2). |
| 51 | Reverse frequency disabling | Reverse frequency disabling: the drive runs at 0 Hz when it is reversed. |

The 16-segment operating frequency can be set by the four multi-segment command terminals maximally, which can be selected through the arrangement and combination of four X terminals. Multi-segment frequency setting can also be performed with less than 4X terminals. For the missing set bits, it is calculated as 0, as shown in the following table:

| K4 | K3 | K2 | K1 | Instruction setting | Corresponding parameter |
|----|----|----|----|----------------------------|-------------------------|
| 0 | 0 | 0 | 0 | Multi-segment frequency 0 | FA-00 |
| 0 | 0 | 0 | 1 | Multi-segment frequency 1 | FA-01 |
| 0 | 0 | 1 | 0 | Multi-segment frequency 2 | FA-02 |
| 0 | 0 | 1 | 1 | Multi-segment frequency 3 | FA-03 |
| 0 | 1 | 0 | 0 | Multi-segment frequency 4 | FA-04 |
| 0 | 1 | 0 | 1 | Multi-segment frequency 5 | FA-05 |
| 0 | 1 | 1 | 0 | Multi-segment frequency 6 | FA-06 |
| 0 | 1 | 1 | 1 | Multi-segment frequency 7 | FA-07 |
| 1 | 0 | 0 | 0 | Multi-segment frequency 8 | FA-08 |
| 1 | 0 | 0 | 1 | Multi-segment frequency 9 | FA-09 |
| 1 | 0 | 1 | 0 | Multi-segment frequency 10 | FA-10 |
| 1 | 0 | 1 | 1 | Multi-segment frequency 11 | FA-11 |
| 1 | 1 | 0 | 0 | Multi-segment frequency 12 | FA-12 |
| 1 | 1 | 0 | 1 | Multi-segment frequency 13 | FA-13 |
| 1 | 1 | 1 | 0 | Multi-segment frequency 14 | FA-14 |
| 1 | 1 | 1 | 1 | Multi-segment frequency 15 | FA-15 |

The dimension of multi-segment instruction is a relative value, which is the percentage of the relative maximum frequency F0-10. The positive and negative parameters determine the running direction. If it is negative, it means that the drive runs in reverse.

The function description of acceleration and deceleration time selection terminal is shown in the following table:

| Terminal 1 | Terminal 2 | Acceleration or deceleration time selection | Corresponding parameter |
|------------|------------|---|----------------------------|
| 0 | 0 | Acceleration\Deceleration time 1 | F0-17\F0-18 |
| 0 | 1 | Acceleration\Deceleration time 2 | F8-03\F8-04 |
| 1 | 0 | Acceleration\Deceleration time 3 | F8-05\F8-06 |
| 1 | 1 | Acceleration\Deceleration time 4 | F8-07\F8-08 |

| EE 10 | X terminal filtering time | Factory value | 0. 010s | Attribute | 0 |
|-------|---------------------------|---------------|-----------------|-----------|---|
| F3-10 | Setting range | | 0.000s ~ 1.000s | | |

It is used to set the filtering time of X terminal. Reducing this parameter can speed up the response time of X terminal, but also reduce its anti-interference ability; Increasing this parameter can enhance the anti-interference ability, but also slow down the response of X terminal.

| - F5-11 | Terminal command mod | Factory value | 0 | Attribute | ۲ | | | | | |
|------------|----------------------|---------------|-------------------|-----------------|---|--|--|--|--|--|
| | | 0 | Two | Two-wire type 1 | | | | | | |
| | Catting many | 1 | Two-wire type 2 | | | | | | | |
| | Setting range | 2 | Three-wire type 1 | | | | | | | |
| | | 3 | Three-wire type 2 | | | | | | | |

 $X1 \sim X4$ and HDI input terminals can be selected as external input terminals, that is, the functions of X1 $\sim X4$ and HDI input terminals can be selected by setting the values of F5.00 \sim F5.04.

0: Two-wire control mode 1:

As shown in the figure below, when K1 is connected alone, the drive runs forward; When K2 is connected alone, the drive runs in reverse; When K1 and K2 are connected or disconnected at the same time, the drive stops running.

The function code is set as follows:

| Function code | Name | Set value | Parameter description |
|---------------|---------------------------------|-----------|-----------------------|
| F0-02 | Run command channel selection | 1 | Terminal control |
| F5-11 | Terminal control mode selection | 0 | Two-wire type 1 |
| F5-00 | X1 terminal function selection | 1 | Forward (FWD) |
| F5-01 | X2 terminal function selection | 2 | Reverse (REV) |

1: Two-wire control mode 2:

In this mode, the X1 terminal is the operation enable terminal, and the function of the X2 terminal is determined running direction. As shown in the figure below, when K1 is connected in this mode, K2 is disconnected and the drive runs forward, or K2 is connected and the drive runs in reverse; When K1 is disconnected, the drive stops running.

CHNT NVF7 Series Drive Operation Instructions

The function code is set as follows:

| Function code | Name | Set value | Parameter description |
|---------------|---------------------------------|-----------|---|
| F0-02 | Run command channel selection | 1 | Terminal control |
| F5-11 | Terminal control mode selection | 1 | Two-wire type 2 |
| F5-00 | X1 terminal function selection | 1 | Forward (acting as "operation enable") |
| FF 01 | V2 to start for the start | 2 | Reverse (acting as "forward and reverse |
| F5-01 | X2 terminal function selection | 2 | direction") |

2: Three-wire control mode 1:

In this mode, the X3 terminal is the operation enabling terminal, and the direction is controlled by X1 and X2 respectively. As shown in the figure below, in this control mode, when the SB1 key is in connected state, press SB2 to make the drive run forward, press SB3 to make the drive run reversely; when the SB1 key is disconnected, the drive stops.

During normal startup and operation, the SB1 key must be kept connected, and the command of the SB2 and SB3 keys takes effect whenever the connection action occurs. The running state of the drive is subject to the last action of the 3 keys.

| Function code | Name | Set value | Parameter description |
|---------------|---------------------------------|-----------|----------------------------|
| F0-02 | Run command channel selection | 1 | Terminal control |
| F5-11 | Terminal control mode selection | 2 | Three-wire type 1 |
| F5-00 | X1 terminal function selection | 1 | Forward (FWD) |
| F5-01 | X2 terminal function selection | 2 | Reverse (REV) |
| F5-02 | X3 terminal function selection | 3 | Three-wire running control |

The function code is set as follows:

3: Three-wire control mode 2:

In this mode, the X3 terminal is the running enabling terminal, the run command is set by X1, and the direction is determined by the state of X2. As shown in the figure below, in this control mode, when the SB1 key is closed, press the SB2 key to run the drive, disconnect K for forward rotation of the drive and connect K for reverse rotation of the drive; When the SB1 key is turned off, the drive stops. During normal startup and running, the SB1 key must be kept connected, and the command of the SB2 key will take effect at the edge of the connect action.

The function code is set as follows:

| Functio | n code | Name | | Set value | Paran | neter descriptior | 1 | |
|---------|--------|--------------------------------|------|-------------|--|--|---------|--|
| F0- | 02 | Run command channel selec | tion | 1 | Terminal control | | | |

| F5-17 | Setting range | | 0.00s~10.0 | 0s | |

The setting of AI curve is actually to set the relationship between analog input voltage (or analog input current) and its representative set frequency. When AI is set as frequency, 100.0% of the corresponding setting of voltage or current input refers to the relative (maximum output frequency F0-10) percentage. 2-point curve: Take curve 1 as an example, and the detailed parameters and descriptions are as follows:

All filtering time: It is used to set the software filtering time of Al1. The longer the filtering time, the stronger the anti-interference ability but the slower the response speed to analog detection.

| | | Hund | AI3 curve selection (1~5, same as above) | | | | | |
| | | reds | | | | | | |

The units, tens and hundreds of the function code are used for selection respectively, and the analog inputs are the corresponding setting curves of AI1, AI2 and AI2. Any of the five curves can be selected respectively for any of the three analog curves.

Curves 1, 2 and 3 are all 2-point curves, which are set in F5 group function codes, while curves 4 and 5 are all 4-point curves, which need to be set in A0 group function codes.

The standard terminal of NVF7 drive provides two analog inputs, and the used AI3 shall be configured with multi-function input/output optional cards.

| EE 24 | Selection of AI be minimum input | low the setting | Factory value 000 | | Attribute | 0 | |
|-------|-------------------------------------|-----------------|--|--|-----------|--------|--|
| | Setting range | Units | Selection of Al1 below the minimum setting | | | | |
| | | 0 | Corresponding minimum input setting | | | | |
| F5-34 | | 1 | 0.0% | | | | |
| | | Tens | Selection of AI2 below the mir | AI2 below the minimum input setting (0~1, same as ab | | above) | |
| | | Hund | | | | | |
| | | reds | Selection of AI3 below the minimum input setting (0~1, same as abo | | | | |

This function code is used to set how to determine the corresponding setting of analog when the voltage of analog input is less than the set "minimum input".

The units, tens and hundreds of this function code . correspond to analog inputs AI1, AI2 and AI3 respectively.

When the Al input is lower than the minimum input, if 0 is selected, the corresponding setting of the analog is the "minimum input corresponding setting" set by the function code; If 1 is selected, the corresponding setting of the analog is 0.0%.

| F5-35 | X1 delay time | Factory value | 0.0s | Attribute | 0 |
|-------|---------------|---------------|------|-----------|---|
| | Setting range | 0.0s~3600.0s | | | |
| F5-36 | X2 delay time | Factory value | 0.0s | Attribute | 0 |
| | Setting range | 0.0s~3600.0s | | | |
| F5-37 | X3 delay time | Factory value | 0.0s | Attribute | 0 |
| | Setting range | 0.0s~3600.0s | | | |

This function code is used to set the delay time for X terminal to change its state. At present, X4 and HDI do not have this function.

| F5-38 | X terminal effective mode selection | | Factory value | 00000 | Attribute | 0 |
|-------|--|----------------------|---|---|------------------|---|
| | | Units | X1 terminal valid state setting | | | |
| | | 0 | Н | High level valid | | |
| | Setting range | 1 | Low level valid | | | |
| | | Tens | Valid state setting of | Valid state setting of X2 terminal (0~1, same as above) | | |
| | | Hundr | Valid state setting of X3 terminal (0~1, same as above) | | | |
| | | Thous ands | Valid state setting of 2 | f X4 terminal (0~1, same as above | | |
| | | Ten thousa nds | Valid state setting of H | HDI terminal (0~1 | , same as above) | |

This function code is used to set the valid state mode of digital input terminal.

When 0 is selected, the communication between COM terminal and X terminal is valid, but the disconnection is invalid;

When 1 is selected, the communication between COM terminal and X terminal is invalid, but the disconnection is valid;

| +5-52 | Setting range | | -10.00V ~ 10.00V | | |

This group of function codes is used to correct analog AI to eliminate the influence of null bias and gain of AI input port.

This group of function code parameters has been corrected at the factory, and when the factory value is restored, it will be restored to the corrected factory value. Generally, it does not need to be modified at the application site.

The measured voltage refers to the actual voltage measured by measuring instruments such as multimeter, and the displayed voltage refers to the voltage display value sampled by drive. See AI voltage display before correction in U0 group (U0-21, U0-22, U0-23).

During correction, two voltage values are respectively input into each Al input port, and the values measured by multimeter and the values read by U0 group are accurately input into the above function codes, then the drive will automatically correct the null bias and gain of Al.

For occasions where the voltage set by the user does not match the actual sampling voltage of the drive, the field correction method can be adopted to make the sampling value of the drive consistent with the expected set value. Taking Al1 as an example, the field correction method is as follows:

- 1. Set the AI1 voltage signal (about 2V)
- 2. Measure the voltage value of AI1, and record it as V1
- 3. Check the displayed value of U0-21, and record it as V2
- 4. Set the Al1 voltage signal (about 8V)
- 5. Measure the voltage value of AI1, and record it as V3
- 6. Check the displayed value of U0-21, and record it as V4
- 7. Save parameter V1 in parameter F5-41, V2 in parameter F5-42, V3 in parameter F5-43 and V4 in parameter F5-44

When Al2 and Al3 are corrected, the actual sampling voltage viewing positions are U0-22 and U0-23 respectively. For Al1 and Al2, it is recommended to use 2V and 8V as correction points, and for Al3, it is recommended to sample -8V and 8V as correction points.

| F5-53 | AI2 measured current 1 | Factory value | Factory correction | Attribute | 0 |
|-------|-------------------------|----------------|--------------------|-----------|---|
| | Setting range | 0mA ~ 20.000mA | | | |
| F5-54 | AI2 displayed current 1 | Factory value | Factory correction | Attribute | 0 |
| | Setting range | 0mA ~ 20.000mA | | | |
| | AI2 measured current 2 | Factory value | Factory correction | Attribute | 0 |
| F5-55 | Setting range | | 0mA ~ 20.000mA | | |
| F5-56 | AI2 displayed current 2 | Factory value | Factory correction | Attribute | 0 |
| | Setting range | | 0mA ~ 20.000mA | | |

This group of function codes is used to correct the analog AI2 input current.

The correction method is consistent with the Al2 voltage correction method.

12.7 F6 group output terminal

| F6-00 | HDO terminal output mode selection | | Factory value | 0 | Attribute | 0 |
|-------|------------------------------------|---|-------------------------|---|-----------|---|
| | 6 | 0 | High speed pulse output | | | |
| | Setting range 1 | | Switch output | | | |

HDO terminal is a programmable multiplexing terminal, which can be used as a high-speed pulse output terminal and also as a switch output terminal of open collector.

As a high-speed pulse output terminal, the output pulse can reach up to 100KHz. See F6-06 for the specific function of HDO.

| FC 01 | HDO function selection | Factory value | 0 | Attribute | 0 |
|-------|---------------------------------|---------------|------|-----------|---|
| F6-01 | Setting range | | 0~41 | | |
| FC 02 | Function selection of relay RO1 | Factory value | 2 | Attribute | 0 |
| F6-02 | Setting range | | 0~41 | | |
| F6-04 | Function selection of relay RO2 | Factory value | 1 | Attribute | 0 |
| | Setting range | 0~41 | | | |

The above function codes are used to set the functions of 3 digital outputs, and the functions of multifunction output terminals are described in the following table:

| Set value | Function | Notes |
|-----------|--------------------------------------|--|
| 0 | No output | The output terminal has no function |
| 1 | Drivo rupping | It means that the drive is running and has an output frequency (which |
| ' | Drive running | can be zero), in which case the ON signal is output. |
| 2 | Fault output (fault stop) | When the drive is faulty and stops, the ON signal is output. |
| 3 | Frequency level detection | Please refer to the description of function codes F8-19 and F8-20. |
| | FDT1 output | |
| 4 | Frequency reached | Please refer to the description of function codes F8-21. |
| - | Running at zero speed (no | When the drive is running and the output frequency is 0, the ON signal |
| 5 | output when stopping) | is output. When the drive is in stop state, the signal is OFF. |
| | Motor overload pre-alarm | Before motor overload protection action, judge according to the |
| 6 | | threshold of overload pre-alarm, and output ON signal after the |
| 0 | | threshold of pre-alarm is exceeded. Refer to function codes FE-00 ~ |
| | | FE-02 for motor overload parameter setting. |
| 7 | Drive overload pre-alarm | 10s before the drive overload protection acts, output ON signal. |
| 8 | Set counting pulse reached | Please refer to the description of function codes F9-37. |
| 9 | Designated counting pulse reached | Please refer to the description of function codes F9-38. |
| 10 | Length reached | Please refer to the description of function codes F9-34 and F9-35. |
| | | When the simple PLC runs for one cycle, it outputs a pulse signal with a |
| 11 | PLC cycle completed | width of 250 ms. |

| Set value | Function | Notes |
|-----------|---------------------------------------|--|
| 40 | Cumulative running time | When the cumulative running time of the drive exceeds the time set by |
| 12 | reached | F8-17, the ON signal is output. |
| | | When the set frequency exceeds the upper limiting frequency or the |
| 12 | Frequency limiting | lower limiting frequency, and the output frequency of the drive also |
| 15 | | reaches the upper limiting frequency or the lower limiting frequency, the |
| | | ON signal is output. |
| | | In the speed control mode, when the output torque reaches the torque |
| 14 | Torque limiting | limit value, the drive is in the stall protection state and outputs the ON |
| | | signal at the same time. |
| | | When the power supply of the main circuit and control circuit of the |
| 15 | Ready for running | drive has been stabilized, and the drive has not detected any fault |
| | , , , , , , , , , , , , , , , , , , , | information, and the drive is in an runnable state, the ON signal is |
| | | output. |
| 16 | AI1>AI2 | When the value of analog input AI'l is greater than the input value of |
| | the second sector second | AI2, the ON signal is output. |
| 17 | Upper limiting frequency | When the operating frequency reaches the upper limiting frequency, the |
| | Lower limiting frequency | |
| 18 | reached (no output when | When the operating frequency reaches the lower limiting frequency, the |
| 10 | stopping) | ON signal is output. The signal is OFF in stop state. |
| 19 | Undervoltage state output | When the drive is undervoltage, the ON signal is output. |
| 20 | Communication control | Communication control |
| 21 | Reserved | Reserved |
| 22 | Reserved | Reserved |
| | Running at zero speed 2 | When the output frequency of the drive is 0, the ON signal is output |
| 23 | (also output when | The signal is also ON in step state |
| | stopping) | |
| 24 | Cumulative power-on time | When the cumulative power-on time (U0-80) of the drive exceeds the |
| | reached | time set by F8-16, the ON signal is output. |
| 25 | Frequency level detection | Please refer to the description of function codes F8-28 and F8-29. |
| | FDT2 output | |
| 26 | Output of frequency 1 | Please refer to the description of function codes F8-30 and F8-31. |
| | Output of fraguancy 2 | |
| 27 | output of frequency 2 | Please refer to the description of function codes F8-32 and F8-33. |
| | Output of current 1 | |
| 28 | reached | Please refer to the description of function codes F8-38 and F8-39. |
| | Output of current 2 | |
| 29 | reached | Please refer to the description of function codes F8-40 and F8-41. |
| | | When the timing function selection (F8-42) is valid, the drive will output |
| 30 | Output of timing reached | the ON signal after the current running time reaches the set time. |
| | | When the value of analog input Al1 is greater than F8-46 (the upper |
| 31 | Al1 input overrun | limit of AI1 input protection) or less than F8-45 (the lower limit of AI1 |
| | | input protection), the ON signal is output. |
| 32 | Unloading | When the drive is in unloading state, the ON signal is output. |
| 33 | In reverse running | When the drive is reverse running, the ON signal is output |
| 34 | Zero current state | Please refer to the description of function codes F8-34 and F8-35 |
| 35 | Module temperature | When the radiator temperature of the inversion module (U0-75) reaches |
| | reached | the set module temperature reached (F8-47), the ON signal is output |

CHNT NVF7 Series Drive Operation Instructions

| Set value | Function | Notes |
|-----------|--|--|
| 36 | Software current overrun | Please refer to the description of function codes F8-36 and F8-37. |
| 37 | Lower limiting frequency reached (also output when stopping) | When the operating frequency reaches the lower limiting frequency, the ON signal is output. The signal is also ON in stop state. |
| 38 | Alarm output | When the drive fails with a fault to be handled by continuous running, the drive is subject to alarm output. |
| 39 | Reserved | Reserved |
| 40 | Current running time reached | When the start running time of the drive exceeds the time set by F8-53, the ON signal is output. |
| 41 | Fault output | The fault of free stop and undervoltage are not output. |

| F6-06 | HDO function selection | Factory value | 0 | Attribute | 0 |
|-------|-------------------------------|---------------|------|-----------|---|
| | Setting range | | 0~16 | | |
| F6-07 | AO1 output function selection | Factory value | 0 | Attribute | 0 |
| | Setting range | | 0~16 | | |
| F6-08 | AO2 output function selection | Factory value | 1 | Attribute | 0 |
| | Setting range | 0~16 | | | |

The output pulse frequency of HDO terminal ranges from 0.01 kHz to F6-09 (the maximum output frequency of HDO), and F6-09 can be set between 0.01 kHz and 100.00 kHz.

The analog output AO1 and AO2 range from 0V to 10V, or from 0mA to 20mA. The calibration relationship between the range of pulse output or analog output and the corresponding function is shown in the following table:

| Set value | Function | Functional scope (corresponding to 0.0%~100.0% of pulse or analog output) |
|-----------|------------------------------------|--|
| 0 | Operating frequency | 0 ~ maximum output power |
| 1 | Set frequency | 0 ~ maximum output power |
| 2 | Output current | 0 ~ 2 times rated current of motor |
| 3 | Output torque (absolute value) | 0 ~ 2 times rated torque of motor |
| 4 | Output power | 0 ~ 1 times rated power of motor |
| 5 | Output voltage | 0 ~ 1.2 times rated voltage of drive |
| 6 | PULSE input | 0.01kHz ~ 100.00kHz |
| 7 | AI1 | 0V ~ 10V (or 0 ~ 20mA) |
| 8 | AI2 | 0V ~ 10V (or 0 ~ 20mA) |
| 9 | AI3 | 0V ~ 10V (or 0 ~ 20mA) |
| 10 | Length | 0 ~ maximum set length |
| 11 | Count value | 0 ~ maximum count value |
| 12 | Communication setting | 0.0% ~ 100.0% |
| 13 | Motor speed | Speed corresponding to 0 ~ maximum output frequency |
| 14 | Output current | 0.0A ~ 1000.0A |
| 15 | Output voltage | 0.0V ~ 1000.0V |
| 16 | Motor output torque (actual value, | -2 times the rated torque of motor ~ 2 times the rated |
| 10 | percentage relative to motor) | torque of motor |

| FC 00 | Maximum frequency of HDO outpu | t Factory value | 50.00KHz | Attribute | 0 |
|---|--------------------------------|-------------------------------|----------|-----------|---|
| F6-09 | Setting range | 0.01kHz ~ 100.00kHz | | | |
| This function code is used to set the HDO terminal as the upper limit of high-speed pulse output. | | | | | |
| FC 10 | AO1 zero bias coefficient | Factory value 0.00% Attribute | | | 0 |
| F6-10 | Setting range | -100.0% ~ +100.0% | | | |

| F6-11 | AO1 gain | Factory value | 1 | Attribute | 0 | |
|-------|---------------------------|-----------------|---------------------|-----------|---|--|
| | Setting range | -10.00 ~ +10.00 | | | | |
| F6-12 | AO2 zero bias coefficient | Factory value | Factory value 0.00% | | 0 | |
| | Setting range | | -100.0% ~ +100.0% | | | |
| F6-13 | AO2 gain | Factory value | 1 | Attribute | 0 | |
| | Setting range | -10.00 ~ +10.00 | | | | |

This function code is used to set the null bias and gain of AO1 and AO2 analog outputs. When the actual setting is different from the display of the drive, it can be corrected by this parameter, and it can also be used to customize the AO curve.

If the null bias is represented by "A", the gain is represented by k, the actual output is represented by Y, and the standard output is represented by X, then the actual output is:

Y = kX + a

Wherein, the null bias coefficient of AO1 and AO2 is 100% corresponding to 10V (or 20mA), and the standard output refers to the quantity represented by the analog output corresponding to the output of 0V \sim 10V (or 0MA \sim 20MA) without null bias and gain correction.

For example, if the analog output content is the operating frequency, and it is expected that the actual output is 8V when the frequency is 0 and 3V when the frequency is the maximum, the gain shall be set to "-0.5" and the null bias shall be set to "80%".

| F6-17 | HDO output delay time | Factory value | 0.0s | Attribute | 0 | |
|-------|-----------------------|----------------|----------------|-----------|---|--|
| | Setting range | | 0.0s ~ 3600.0s | | | |
| F6-18 | RO1 output delay time | Factory value | 0.0s | Attribute | 0 | |
| | Setting range | 0.0s ~ 3600.0s | | | | |
| 56.40 | DO1 output delay time | Factory value | 0.0s | Attribute | 0 | |
| F6-19 | Setting range | 0.0s ~ 3600.0s | | | | |
| 56.00 | RO2 output delay time | Factory value | 0.0s | Attribute | 0 | |
| F6-20 | Setting range | 0.0s ~ 3600.0s | | | | |
| F6-21 | DO2 output delay time | Factory value | 0.0s | Attribute | 0 | |
| | Setting range | 0.0s ~ 3600.0s | | | | |

The above function code is used to set the delay time from the state occurrence to the actual output change of HDO output terminal, relay 1 and relay 2.

| F6-22 | Valid state selection | of DO output terminal | Factory value | 00000 | Attribute | 0 | |
|-------|-----------------------|-----------------------|----------------|-------|-----------|---|--|
| | Setting range | Units | HDO | | | | |
| | | 0 | Positive logic | | | | |
| | | 1 | Negative logic | | | | |
| | | Tens | RO1 | | | | |
| | | Hundreds | DO1 | | | | |
| | | Thousands | RO2 | | | | |
| | | Ten thousands | DO2 | | | | |

This function code is used to set the output logic of HDO output terminal, relay 1 and relay 2.

- 0: Positive logic, if the digital output terminal and the corresponding common terminal are connected, it is a valid state, otherwise, it is an invalid state;
- 1: Negative logic, if the digital output terminal and the corresponding common terminal are connected, it is an invalid state, otherwise, it is a valid state.

| F6-24 | AO1 target voltage 1 | Factory value Factory correction | | Attribute | 0 |

| | | | communication command channel) | | | | | |
| | | 2 | Forward and reverse running switching | | | | | |
| | | 3 | Forward jog | | | | | |
| | | 4 | Reverse jog | | | | | |

This function code is used to set the function of MF key. This key can be used to switch between stop and running.

0: No function

1: Keyboard command and remote operation switching

It refers to the switch of command source, that is, the switch between the current command source and keyboard control (local operation). If the current command source is keyboard control, this key function is invalid.

2: Forward and reverse running switching

Switch the direction of frequency instruction by MF key. This function is only valid when the command source is the command channel of the operation panel.

3: Forward jog

Forward jog (FJOG) is realized by keyboard MF key.

4: Reverse jog

Reverse jog (RJOG) is realized by keyboard MF key.

Running display parameter: It is used to set the parameters that can be viewed when the drive is running. The maximum number of state parameters available for viewing is 32. Select the state parameters to be displayed according to the binary digits of the parameter values F7-04 and F7-05, and the display order starts from the lowest digit of F7-04.

| | LED shutdo | wn display | Factory value | 33 | Attribute | 0 |
|-------|--------------------------|------------------------------|---------------|--|--|---|
| F7-06 | parar | 0000~FFFF | | 4 3 2 1 0 Set frequency Bis voltage (D1 input stat D0 output stat A11 voltage (A12 voltage (Count value 12 11 10 \$ Leargth value PIC stage HD1 input r | r (IIz) V) ite V) V) V) v) se display uulue frequency (KHz) | |
| F7-07 | Load speed dis Settin | splay coefficient g range | Factory value | 1.0000 0.001 ~ 6.5000 | Attribute | 0 |

When the load speed needs to be displayed, through this parameter, the corresponding relationship between the output frequency of the drive and the load speed is adjusted. Refer to F7-08 for specific correspondence.

| Number of deci speed | Number of decimal places of load speed display | | Factory value 21 Attribut | | | 0 | |
|-------------------------|---|-------|------------------------------|--|--|---|--|
| | C. III | Units | Decimal place in U0-14 | | | | |
| F7-08 | | 0 | 0-digit decimal display | | | | |
| | | 1 | 1-digit decimal display | | | | |
| | | 2 | 2-digit decimal display | | | | |
| | Setting range | 3 | 3-digit decimal display | | | | |
| | | Tens | Decimal place in U0-19/U0-29 | | | | |
| | - | 1 | 1 decimal point | | | | |
| | | 2 | 2 decimal point | | | | |

This function code is used to set the number of decimal places for load speed display.

For example, the load speed display coefficient F7-07 is 2.000, the number of load speed decimal places F7-08 is 2, and when the drive runs at 40.00Hz, the load speed is 40.00*2.000=80.00 (2 is decimal place display); If the drive is in the stop state, the load display speed corresponds to the set frequency.

Tens:

1: U0-19/U0-29 are displayed with one decimal place respectively.

2: U0-19/U0-29 are displayed with two decimal place respectively.

| | Display selection of function | | Eactory value | 11 | Attributo | | |

| F7-10 | C. III | 1 | | Display | | | |
| | Setting range | Tens | Display selection of user change parameter | | | | |
| | | 0 | | Not display | | | |
| | | 1 | | Display | | | |

The establishment of parameter display mode is mainly convenient for users to view different arrangement of functional parameters according to actual needs, with three parameter display methods provided.

| Name | Description | | |
|----------------------|---|--|--|
| Functional parameter | The functional parameters of drive are displayed in sequence, including F0~FE, A0, A5 | | |
| mode | and U0 respectively | | |
| User-defined | User-defined individual function parameters for display (up to 32): The user can | | |
| parameter mode | determine the functional parameters to be displayed through FF group | | |
| User-changed | | | |
| parameter mode | Parameters inconsistent with factory parameters | | |

When one of the display options of customized parameter mode (F7-10) is display, you can switch to different parameter display methods by using the QUICK key, and only the functional parameter method is available by default.

The display code of each parameter display mode is:

| Parameter display | Display |
|-------------------------|---------|
| Full-function parameter | -ALL- |
| User-defined parameters | U |
| User-changed parameters | C |

NVF7 drive provides two sets of customized parameter display modes: user-defined parameter mode and user-changed parameter mode. User-defined parameter group refers to the parameters set to FF group by users, with a maximum of 32 parameters to be selected. These parameters can be summarized together, which is convenient for customers to debug.

In the user-defined parameter mode, a symbol U is added by default before the user-defined function code, for example: F1-00, in the user-defined parameter mode, the display effect is uF1-00.

In the user-changed parameter mode, the parameters are changed by users, which are different from the factory values of manufacturers. User-changed parameter group is helpful for customers to view the summary of changed parameters and find problems on site.

In the user-changed parameter mode, a symbol c is added before the user-defined function code by default, for example, F1-00. In the user-changed parameter mode, the display effect is cF1-00.

| | Parameter cha | Parameter change attribute | | Factory value 0 Attribute | | |
|-------|---------------|----------------------------|------------|---------------------------|--|--|
| F7-11 | Setting range | 0 | Modifiable | | | |
| | | 1 | | Non-modifiable | | |

Whether the user-set function code parameter of this function code can be modified, to prevent the parameters from being modified by mistake.

0:All function codes can be modified;

1:All function codes cannot be modified.

12.9 F8 group auxiliary function

| F8-00 | Jog operating frequency | Factory value | 2.00Hz | Attribute | 0 | |
|-------|-------------------------|----------------------------|-------------------------|-----------|---|--|
| | Setting range | 0.00Hz ~ maximum frequency | | | | |
| F8-01 | Jog acceleration time | Factory value | 20.0s | Attribute | 0 | |
| | | (| 0.00s ~ 650.00s (F0-19= | 2) | | |
| | Setting range | 0.0s ~ 6500.0s (F0-19=1) | | | | |
| | | Os ~ 65000s (F0-19=0) | | | | |
| | Jog deceleration time | Factory value | 20.0s | Attribute | 0 | |
| E0 02 | | 0.00s ~ 650.00s (F0-19=2) | | | | |
| F8-02 | Setting range | 0.0s ~ 6500.0s (F0-19=1) | | | | |
| | | 0s ~ 65000s (F0-19=0) | | | | |

During jogging running, the start mode is fixed as direct start, and the stop mode is fixed as stop by deceleration.

| | Acceleration time 2 | Factory value | Model determination | Attribute | 0 | | |
|-------|---------------------|-----------------------------------|--------------------------|-----------|---|--|--|
| E8 02 | | 0.00s ~ 650.00s (F0-19=2) | | | | | |
| F6-03 | Setting range | | 0.0s ~ 6500.0s (F0-19=1) | | | | |
| | | | 0s ~ 65000s (F0-19=0) | | | | |
| | Deceleration time 2 | Factory value Model determination | | Attribute | 0 | | |
| E9 04 | | 0.00s ~ 650.00s (F0-19=2) | | | | | |
| F0-04 | Setting range | 0.0s ~ 6500.0s (F0-19=1) | | | | | |
| | | | 0s ~ 65000s (F0-19=0) | | | | |
| | Acceleration time 3 | Factory value Model determination | | Attribute | 0 | | |
| | | | | | | | |
| F0-05 | Setting range | 0.0s ~ 6500.0s (F0-19=1) | | | | | |
| | | 0s ~ 65000s (F0-19=0) | | | | | |

| E8 06 | Deceleration time 3 | Factory value | Model determination | Attribute | 0 | | |
|-------|---------------------|---------------------------|---------------------------|-----------|---|--|--|
| | | | 0.00s ~ 650.00s (F0-19=2) | | | | |
| F0-00 | Setting range | | 0.0s ~ 6500.0s (F0-19=1) | | | | |
| | | | 0s ~ 65000s (F0-19=0) | | | | |
| | Acceleration time 4 | Factory value | 0.0s | Attribute | 0 | | |
| F8-07 | | 0.00s ~ 650.00s (F0-19=2) | | | | | |
| 10-07 | Setting range | 0.0s ~ 6500.0s (F0-19=1) | | | | | |
| | | Os ~ 65000s (F0-19=0) | | | | | |
| | Deceleration time 4 | Factory value | 0.0s | Attribute | 0 | | |
| F0 00 | | | 0.00s ~ 650.00s (F0-19=2) | | | | |
| F0-U0 | Setting range | 0.0s ~ 6500.0s (F0-19=1) | | | | | |
| | | Os ~ 65000s (F0-19=0) | | | | | |

Through different combinations of multi-function digital input terminals X, you can switch between acceleration and deceleration time 1 and acceleration and deceleration time 4. Please refer to the X function description section for specific usage. Where, in the torque mode of drive vector control, the output frequency change corresponds to the acceleration and deceleration time 4, which is 0s by default.

| F8-09 | Jump frequency 1 | Factory value | 0.00Hz | Attribute | 0 |
|-------|--------------------------|----------------------------|--------|-----------|---|
| | Setting range | 0.00Hz ~ maximum frequency | | | |
| F8-10 | Jump frequency 2 | Factory value | 0.00Hz | Attribute | 0 |
| | Setting range | 0.00Hz ~ maximum frequency | | | |
| F8-11 | Jump frequency amplitude | Factory value | 0.00Hz | Attribute | 0 |
| | Setting range | 0.00Hz ~ maximum frequency | | | |

When the set frequency is within the jump frequency range, the actual operating frequency will run at the jump frequency close to the set frequency. By setting the jump frequency, the drive can avoid the mechanical resonance point of the load. Two jump frequency points can be set. If both jump frequencies are set to 0Hz, the jump frequency function will be cancelled. The principle of jump frequency and jump frequency amplitude is shown in the following figure:

| E0 12 | Dead time of forward and reverse running | Factory value 0.0s Attrib | | Attribute | 0 |
|-------|--|---------------------------|-----------|-----------|---|
| F8-12 | Setting range | 0.0s | ~ 3000.0s | ; | |

This parameter is used to set the holding time at 0Hz when the drive switches from forward (reverse) running to reverse (forward) running.

| | Reverse frequency disablir | Factory value | 0 | Attribute | 0 | |
|-------|----------------------------|---------------|---------|-----------|---|--|
| F8-13 | | 0 | Invalid | | | |
| | Setting range | 1 | | Valid | | |

This parameter is used to set whether the motor is allowed to run in reverse. If the motor is not allowed to run in reverse, it is necessary to validate the reverse frequency disabling.

| | Set frequency lower than the lower limiting frequency operation mode | | Factory value | 0 | Attribute | 0 |
|-------|---|---|-------------------------------------|---|-----------|---|
| F8-14 | | 0 | Run at the lower limiting frequency | | | |
| | Setting range | 1 | Stop | | | |
| | | | Run at zero-speed | | | |

This parameter can be used to set the running state when the set frequency of the drive is lower than the lower limiting frequency.

| F8-15 Droop rate Factory | Factory value | 0.00% | Attribute | 0 | |
|--------------------------|---------------|---------|-----------|---|--|
| F0-15 | Setting range | 0.00% ~ | 10.00% | | |

In the master-slave control system, the droop rate allows a slight speed difference between the master station and the slave station.

The droop rate needs to be adjusted only when the master and slave adopt speed control mode. The droop rate needs to be set according to the actual application. It is recommended not to set F8-15 too large, otherwise the steady-state speed will decrease obviously when the load is heavy. The droop rate must be set for both master and slave.

Droop speed = Synchronous frequency × Output torque × Droop rate ÷ 10

Example: F8-15 = 1.00, synchronous frequency 50Hz, output torque (relative to motor rated torque) 50%, then:

Droop speed = 50Hz×50%×1.00÷10=2.5Hz Actual frequency of drive = 50Hz - 2.5Hz = 47.5Hz NVF7 Series Drive Operation Instructions

| F0 16 | Set cumulative power-on reaching time | Factory value | 0h | Attribute | 0 |
|-------|---------------------------------------|---------------|----------|-----------|---|
| F0-10 | Setting range | 0 | n ~ 6500 | 00h | |

When the cumulative power-on time (U0-80) of the drive reaches the set time of this parameter, the multi-function digital DO can be set to output the ON signal.

| F0 17 | Set cumulative running reaching time | Factory value | 0h | Attribute | ۲ |
|-------|--------------------------------------|---------------|----------|-----------|---|
| F0-17 | Setting range | 0 | h ~ 6500 | 10h | |

When the cumulative running time (U0-77) of the drive reaches the set time of this parameter, the multi -function digital DO can be set to output the ON signal.

| | Start protection selection | Factory value | 0 | Attribute | 0 | |
|-------|----------------------------|---------------|---------------|-----------|----|--|
| F8-18 | 6 | 0 | Not protected | | | |
| | Setting range | 1 | | Protectio | on | |

This parameter relates to the safety protection function of the drive.

If this parameter is set to 1, and when the run command is valid at the power-on moment of the drive or at the fault reset moment (for example, the terminal run command is disconnected before power-on), the drive does not respond to the run command, and the run command must be removed once before the drive responds.

Set this parameter to 1 to prevent the danger caused by the motor responding to the run command when power-on or fault reset without knowing it.

| E9 10 | Frequency detection value 1(FDT1) | Factory value | 50.00Hz | Attribute | 0 | |
|-------|-----------------------------------|----------------------------|---------|-----------|---|--|
| F8-19 | Setting range | 0.00Hz ~ maximum frequency | | | | |
| 50.00 | Frequency detection lag rate 1 | Factory value | 5.0% | Attribute | 0 | |
| F8-20 | Setting range | 0.0% ~ 100.0% | | | | |

When the operating frequency is higher than the frequency detection value, the multi-function output DO of the drive outputs the ON signal, and when the frequency is lower than the detection value by a certain frequency value, the DO output ON signal is cancelled.

The above parameters are used to set the detection value of output frequency and the lag value of output action cancellation. Where, F8-20 is the percentage of the lag frequency relative to the frequency detection value F8-19. The following figure is the schematic diagram of FDT function:

| F8-21 Frequency reaching detection width | Factory value 0.0% Attribute a | | | | |
|--|--------------------------------|-------------------|------------|--------|--|
| FÖ-ZI | Setting range | 0.0% ~ 100.0% (ma | kimum freq | uency) | |

When the operating frequency of the drive reaches between (set frequency - frequency reached detection width) and (set frequency + frequency reached detection width), the multi-function DO of the drive outputs the ON signal. This parameter is the percentage relative to the maximum frequency, and the frequency reaching function is shown below:

When the jump frequency is set to be valid during acceleration and deceleration, the actual operating frequency will skip the set jump frequency range during acceleration or deceleration of the drive.

| F8-25 | Switching of acceleration time 1 and 2 Frequency | Factory value | 0.00Hz | Attribute | 0 |
|-------|---|------------------|-------------|-----------|---|
| | Setting range | 0.00Hz ~ maximur | n frequency | | |
| F8-26 | Switching of deceleration time 1 and 2 Frequency | Factory value | 0.00Hz | Attribute | 0 |
| | Setting range | 0.00Hz | ~ maximum f | requency | |

When the drive fails to select the acceleration and deceleration time through the X terminal, different acceleration and deceleration times can be switched according to the operating frequency.

During acceleration, when the operating frequency is less than F8-25, select acceleration time 2; When the operating frequency is greater than F8-25, select acceleration time 1.

During deceleration, when the running frequency is less than F8-26, select acceleration time 2; When the operating frequency is greater than F8-26, select acceleration time 1.

| Terminal jog priority | | | Factory value | 0 | Attribute | 0 |
|-----------------------|---------------|---|---------------|-------|-----------|---|
| F8-27 | 6 ml | 0 | Invalid | | | |
| | Setting range | 1 | | Valid | | |

This parameter is used to set whether the terminal jog function has the highest priority. When terminal jog is first invalid, if the terminal jog command appears during running, the drive is switched to the terminal jog running state.

| E0 20 | Frequency detection value 2(FDT2) | Factory value | 50.00Hz | Attribute | 0 | |
|-------|-----------------------------------|---------------|--------------|-----------|---|--|
| F0-20 | Setting range | 0.00Hz | ~ maximum fr | equency | | |
| 50.00 | Frequency detection lag rate 2 | Factory value | 5.0% | Attribute | 0 | |
| F8-29 | Setting range | 0.0% ~ 100.0% | | | | |

This function is the same as that of FDT1. Please refer to the relevant instructions of F8-19 and F8-20.

| E0 20 | Arbitrary reaching frequency detection value 1 | Factory value | 50.00Hz | Attribute | 0 |
|-------|--|-----------------------------------|--------------|--------------|---|
| F0-50 | Setting range | 0.00Hz ~ maximum frequency | | | |
| E0 21 | Arbitrary reaching frequency detection width 1 | Factory value | 0.0% | Attribute | 0 |
| F0-31 | Setting range | 0.0% ~ 100.0% (maximum frequency) | | | |
| E0 22 | Arbitrary reaching frequency detection value 2 | Factory value | 50.00Hz | Attribute | 0 |
| F0-32 | Setting range | 0.00Hz | ~ maximum f | requency | |
| E0 22 | Arbitrary reaching frequency detection width 2 | Factory value | 0.0% | Attribute | 0 |
| F8-33 | Setting range | 0.0% ~ 100 | .0% (maximui | m frequency) | |

When the operating frequency of the drive reaches between (any frequency-frequency reached detection width) and (any frequency + frequency reached detection width), the multi-function DO of the drive outputs the ON signal. The function of any frequency reaching detection is as follows:

| E0 24 | Zero current detection level | Factory value | 5.0% | Attribute | 0 | |
|-------|-----------------------------------|-------------------------------------|-------|-----------|---|--|
| F0-34 | Setting range | 0.0% ~ 300.0% (motor rated current) | | | | |
| 50.25 | Zero current detection delay time | Factory value | 0.10s | Attribute | 0 | |
| F0-35 | Setting range | 0.01s ~ 600.00s | | | | |

When the output current of the drive is less than or equal to the zero current detection level and the duration exceeds the zero current detection delay time, the multi-function DO of the drive outputs the ON signal. The zero current detection is as shown in the figure:

| 50.20 | Output current overrun value | Factory value | 200.0% | Attribute | 0 | |
|---------------------|-----------------------------------|-------------------------------------|--------|-----------|---|--|
| F8-36 Setting range | | 0.0% ~ 300.0% (motor rated current) | | | | |
| 50.07 | Output current overrun delay time | Factory value | 0.00s | Attribute | 0 | |
| F0-37 | Setting range | 0.00s ~ 600.00s | | | | |

When the output current of the drive is greater than or equal to the overrun detection point, and the duration exceeds the software overcurrent point detection delay time, the multi-function DO of the drive outputs the ON signal, and the output current overrun function is shown as follows:

When F8-36 current overrun value is set to 0.0%, it will not be detected.

| F0 20 | Arbitrary reaching current 1 | Factory value | 100.0% | Attribute | 0 | | |
|-------|--|---------------|-------------------------------------|---------------|---|--|--|
| F0-30 | Setting range | 0.0% ~ 300 |).0% (motor ra | ated current) | | | |
| F0 20 | Arbitrary reaching current 1 amplitude | Factory value | 0.0% | Attribute | 0 | | |
| F6-39 | F8-39 Setting range | | 0.0% ~ 300.0% (motor rated current) | | | | |
| 50.40 | Arbitrary reaching current 2 | Factory value | 100.0% | Attribute | 0 | | |
| F8-40 | Setting range | 0.0% ~ 300 |).0% (motor ra | ated current) | | | |
| F0 41 | Arbitrary reaching current 2 amplitude | Factory value | 0.0% | Attribute | 0 | | |
| F0-41 | Setting range | 0.0% ~ 300 |).0% (motor ra | ated current) | | | |

When the output current of the drive is within the set positive and negative detected width of any reached current, the multi-function DO of the drive outputs the ON signal.

| | Selection of timing function | on | Factory value | 0 | Attribute | ۲ | | |
|-------|------------------------------|----|--------------------|---------|-----------|---|--|--|
| F8-42 | Catting many | 0 | | Invalid | | | | |
| | Setting range | 1 | | Valid | | | | |
| | Time selection of timing ru | | Factory value | 0 | Attribute | 0 | | |
| | | 0 | F8-44 setting | | | | | |
| F8-43 | Catting many | 1 | AI1 | | | | | |
| | Setting range | 2 | AI2 | | | | | |
| | | 3 | | AI3 | | | | |
| F0 44 | Timing run time | | Factory value | 0.0Min | Attribute | 8 | | |
| F8-44 | Setting range | | 0.0Min ~ 6500.0Min | | | | | |

Time run function:

When the timing function is valid, the drive starts to run at 0 every time. When the set time run time is reached, the drive automatically stops. If the digital multi-function DO or relay output adopts the <time reaching> function, the ON signal is output. The remaining running time can be viewed through U0-20. Note: The analog setting in F8-43 parameters is 100% corresponding to the setting time of F8-44.

 F8-45
 Lower limit of Al1 input voltage protection value
 Factory value
 3.10V
 Attribute
 o

 Setting range
 0.00V ~ F8-46
 0.00V ~ F8-46</t

If the function of <AI1 input overrun> is selected for digital multi-function DO or relay output, DO outputs the ON signal when the analog AI1 input voltage (after calibration) is greater than F8-46 or the AI1 input is less than F8-45.

| 50.47 | Module temperature reached | Factory value | 75℃ | Attribute | 0 |
|-------|----------------------------|---------------|------------|-----------|---|
| F8-47 | Setting range | | 0°C ~ 100° | C | |

If the <module temperature reached> function is selected for the digital multi-function DO or relay output, DO outputs the ON signal when the inversion module temperature reaches the set temperature.

| | Cooling fan control | | Factory value | 0 | Attribute | 0 |
|-------|---------------------|---|----------------------------|---------|-----------|---|
| F8-48 | | 0 | When running, the fan runs | | | |
| | Setting range | 1 | The fa | n keeps | running | |

Fan control mode 0: When the drive is running, the fan runs. When the radiator temperature is higher than 40°C in the stop state, the fan continues to run; When the radiator temperature is lower than 40°C, the fan stops running.

Fan control mode 1:The fan keeps running after powered on.

| E9 40 | Wake-up frequency | Factory value | 0.00Hz | Attribute | 0 |
|-------|--------------------|----------------|----------------|-----------|---|
| F0-49 | Setting range | F8-51 | ~ maximum fre | quency | |
| 50.50 | Wake-up delay time | Factory value | 0.0s | Attribute | 0 |
| F8-50 | Setting range | 0.0s ~ 6500.0s | | | |
| 50.51 | Sleep frequency | Factory value | 0.00Hz | Attribute | 0 |
| F8-51 | Setting range | | 0.00Hz ~ F8-49 | 9 | |
| 50.50 | Sleep delay time | Factory value | 0.0s | Attribute | 0 |
| F8-52 | Setting range | | 0.0s ~ 6500.0s | | |

During the running of the drive, when the set frequency is less than or equal to F8-51 sleep frequency, after F8-52 delay time, the drive enters the sleep state and automatically stops. If the drive is in sleep state and the current run command is valid, the drive will start after a delay time of F8-50 when the set frequency is greater than or equal to F8-49 wake-up frequency. If both the wake-up frequency and the sleep frequency are set to 0.00Hz, the sleep and wake-up functions are invalid.

Note: When the sleep function is enabled, if PID is used as the frequency source, PID shutdown operation must be selected at this time (F9-28).

| F8-53 | Current running time reached | Factory value | 0.0Min | Attribute | 0 |
|-------|------------------------------|---------------|---------------|-----------|---|
| | Setting range | 0. | 0Min ~ 6500.0 | Min | |

If the digital multi-function DO or relay output selects the <this running time reached> function, when the drive reaches this set time, DO outputs the ON signal.

| | Output power correction coefficient | Factory value 100.0% Attribute | | | 0 |
|-------|-------------------------------------|--------------------------------|---------------|---|---|
| F8-54 | Setting range | | 0.0% ~ 200.09 | % | |

This parameter is used to correct the output power displayed in U0-05.

| F8-55 DPWM switching upper limiting frequency | | Factory value 8.00Hz Attribute | | | 0 |
|---|---------------|--------------------------------|-------------|----------|---|
| F8-55 | Setting range | 5.00Hz - | - maximum f | requency | |

When the operating frequency is lower than this set value, it is CPWM modulation mode, and when it is higher than this set value, it is DPWM modulation mode. If the carrier frequency is less than or equal to 2KHz, the debugging mode is fixed as CPWM modulation.

CPWM modulation mode has large switching loss and small current ripple; DPWM modulation mode has small switching loss and large current ripple.

| F8-56 | PWM modulation mode | | Factory value | 0 | Attribute | 0 |
|-------|---------------------|---|-------------------------|---|-----------|---|
| | C. 11 | 0 | Asynchronous modulation | | | |
| | Setting range | 1 | Synchronous modulation | | | |

Under the V/F control mode, when the output frequency of the drive is high, in order to ensure the output voltage quality, synchronous modulation shall be selected, so that the carrier frequency changes with the output frequency and the carrier ratio remains unchanged.

Synchronous modulation takes effect when the operating frequency is higher than 85Hz, and the asynchronous modulation mode is fixed below 85Hz.

| F8-58 | Random PWM o | depth | Factory value | 0 | Attribute | 0 |
|-------|---------------|--------|-------------------------|---|-----------|---|
| | Setting range | 0 | Invalid | | | |
| | | 1 ~ 10 | Random denth adjustment | | | |

When the random depth adjustment is enabled, the carrier frequency output by the drive changes and adjusts within a certain range, which is beneficial to reducing external electromagnetic interference.

| F8-59 | Fast current limiting enable | Factory value | 1 | Attribute | 0 | |
|-------|------------------------------|---------------|---------|-----------|---|--|
| | C. III | 0 | Disable | | | |
| | Setting range | 1 | Enable | | | |

Enable the fast current limiting function to minimize the overcurrent fault of the drive and ensure the uninterrupted operation of the drive. If the drive is in the state of fast current limiting for a long time, it may be damaged by overheating, which is not allowed. Therefore, when the drive is in the state of fast current limiting for a long time, it will report the fault E.CBC and stop.

12.10 F9 group PID function

PID control is a common method of process control. By proportional, integral and differential operation of the difference between the feedback signal of the controlled quantity and the target signal, and by adjusting the output frequency of the drive, a closed-loop system is formed to stabilize the controlled quantity at the target value.

It is suitable for process control occasions such as flow control, pressure control and temperature control. The following figure shows the principle block diagram of PID control.

| | PID set | source | Factory value | 0 | Attribute | 0 |
|-----------|---------------|------------|-------------------|--------------------------|-----------|---|
| | | 0 | | F9-01 setting | | |
| | | 1 | Al1 | | | |
| F9-00 Set | | 2 | | AI2 | | |
| | Setting range | 3 | AI3 | | | |
| | | 4 | Pulse setting HDI | | | |
| | | 5 | | Communication setting | | |
| | | 6 | | Multi-segment instructio | n | |
| F9-01 | PID digit | al setting | Factory value | 50.0% | Attribute | 0 |
| | Setting range | | 0.0% ~ 100.0% | | | |

This function code is used to set the target quantity set channel of process PID.

The set target quantity of process PID is a relative value, and the set range is 0.0%~100.0%. Similarly, the feedback quantity of PID is also a relative quantity, and the function of PID is to make these two relative quantities the same.

| | PID feedba | ack source | Factory value | 0 | Attribute | 0 | |
|-------|---------------|------------|------------------|-----------------------|-----------|---|--|
| | | 0 | AI1 | | | | |
| 50.02 | | 1 | | AI2 | | | |
| | | 2 | | AI3 | | | |
| | | 3 | AI1 - AI2 | | | | |
| F9-02 | Setting range | 4 | | HDI pulse | | | |
| | | 5 | | Communication setting | | | |
| | | 6 | | AI1 + AI2 | | | |
| | | 7 | MAX(AI1 , AI2) | | | | |
| | | 8 | | MIN(AI1 , AI2) | | | |

This parameter is used to select the feedback signal channel of the process PID.

The feedback quantity of process PID is also a relative value, and the set range is 0.0%~100.0%.

| F9-03 | PID effect | direction | Factory value | 0 | Attribute | 0 |
|-------|---------------|-----------|-----------------|---|-----------|---|
| | C 11 | 0 | Positive effect | | | |
| | Setting range | 1 | Negative effect | | | |

This function code is used to set the effect direction of process PID.

Positive effect: When the feedback is greater than the setting, the PID output control quantity decreases. Negative effect: When the feedback is greater than the setting, the PID output control quantity increases. When using this function, it is necessary to combine the influence of negative PID effect of multi-function terminal (function 35).

| PID set feed | PID set feedback range | Factory value | 1000 | Attribute | 0 |
|--------------|------------------------|---------------|-----------|-----------|---|
| F9-04 | Setting range | | 0 ~ 65535 | | |

This function code is used for PID set displays U0-15 and U0-16.

For example, F9-04 is set to 5000, and when PID is set as 100.0%, the set display U0.15 of PID is 5000.

| F9-05 | Proportional gain Kp1 | Factory value | 20.0 | Attribute | 0 | |
|-------|-----------------------|---------------|--------|-----------|---|--|
| F9-05 | Setting range | 0.0 ~ 1000.0 | | | | |
| F9-06 | Integration time Ti1 | Factory value | 2.00s | Attribute | 0 | |
| | Setting range | 0.01s ~ 10.00 | | | | |
| 50.07 | Differential time Td1 | Factory value | 0.000s | Attribute | 0 | |
| F9-07 | Setting range | 0.00 ~ 10.000 | | | | |

1) Proportional gain Kp1:

It determines the regulation strength of the whole PID regulator, and the greater Kp1, the greater the regulation strength. This parameter 100.0 indicates that when the deviation between the PID feedback quantity and the set quantity is 100.0%, the regulation amplitude of the PID regulator to the output frequency instruction is the maximum frequency.

2) Integration time Ti1:

It determines the strength of integral regulation of PID regulator. The shorter the integration time, the greater the regulation strength. The integration time means that when the deviation between the PID feedback quantity and the set quantity is 100.0%, the integral regulator continuously regulates after such time, and the regulation quantity reaches the maximum frequency.

3) Differential time Td1:

It determines the regulation strength of PID regulator on deviation change rate. The longer the differential time, the greater the regulation strength. Differential time means that when the feedback quantity changes by 100.0% during this time, the regulation quantity of differential regulator is the maximum frequency.

| 50.00 | PID inversion cutoff frequency | Factory value | 0.00 | Attribute | 0 |
|-------|--------------------------------|---------------|-------------------------|-----------|---|
| F9-08 | Setting range | | 0.00 ~ maximum frequend | 2y | |

This function code is used to set the maximum reverse PID output frequency operated by the drive.

| PID de | PID deviation limit | Factory value | 0.0% | Attribute | 0 |
|--------|---------------------|---------------|---------------|-----------|---|
| F9-09 | Setting range | | 0.0% ~ 100.0% | | |

This function code is used to set the minimum valid deviation of PID. When the deviation between the PID set quantity and the feedback quantity is less than F9-09, the PID will stop regulating.

| F9-10 PID differential amplitude limit | Factory value 0.10% Attribute o | | | | | |
|--|---------------------------------|--|-----------------|--|--|--|
| F9-10 | Setting range | | 0.00% ~ 100.00% | | | |

This function code is used to set the range of PID differential output, in order to prevent the system oscillation due to over-sensitive differential regulation, and limit the differential function of PID to a small range.

| FO 11 | F9-11 PID set change time | Factory value 0.00s Attribute | | | | |
|-------|---------------------------|-------------------------------|-----------------|--|--|--|
| F9-11 | Setting range | | 0.00s ~ 650.00s | | | |

This function code is used to set the time required for the set value of PID to change from 0.0% to 100.0%. When the given PID changes, the given value of PID changes linearly according to the given change time, which prevents the adverse impact on the system caused by sudden change of the given PID.

| F9-12 | PID feedback filtering time | Factory value | 0.00s | Attribute | 0 | |
|-------|-----------------------------|---------------|-------|-----------|---|--|
| | Setting range | 0.00s ~60.00s | | | | |
| 50.40 | PID output filtering time | Factory value | 0.00s | Attribute | 0 | |
| F9-13 | Setting range | 0.00s ~60.00s | | | | |

The above function codes are used to set PID feedback filtering and PID output filtering respectively. PID feedback filtering is beneficial to reduce the influence of feedback being interfered, but it will lead to the decrease of response performance of process PID control system.

PID output filtering will weaken the abrupt change of drive output frequency, but it will also reduce the response performance of process PID control system.

| 50.45 | Proportion | al gain Kp2 | Factory value | 20.0 | Attribute | 0 |
|-------|--|-------------------------|--|-----------------------------|----------------|---|
| F9-15 | Setting | g range | | 0.0 ~ 1000.0 | | |
| 50.10 | Integration time Ti2 | | Factory value | 2.00s | Attribute | 0 |
| F9-16 | Setting range | | | 0.01s ~ 10.00s | | |
| F0 17 | Differential time Td2 Setting range | | Factory value | 0.000s | Attribute | 0 |
| F9-17 | | | | 0.00 ~ 10.000 | | |
| E9-18 | PID parameter switching condition | | Factory value | 0 | Attribute | 0 |
| | 0 | | No switching | | | |
| F9-18 | Catting | 1 | Switching through X terminal | | | |
| | Setting range | 2 | Automatic switching according to deviation | | | |
| | | 3 | Automatic | switching according to oper | ating frequenc | у |
| F9-19 | PID paramet devia | ter switching tion 1 | Factory value | 20.0% | Attribute | 0 |
| | Setting | g range | 0.0% ~ F9-20 | | | |
| F9-20 | PID paramet devia | ter switching tion 2 | Factory value | 80.0% | Attribute | 0 |
| | Setting range | | F9-19 ~ 100.0% | | | |

In some applications, a group of PID parameters can not meet the needs of the whole operation process, so different PID parameters need to be adopted in different situations.

This group of function codes is used to switch two groups of PID parameters. The setting mode of regulator parameters F9-15~F9-17 is similar to that of parameters F9-05~F9-07.

F9-18 function code is used to set PID parameter switching conditions.

When F9-18 is equal to 0, PID parameters are not switched.

When F9-18 is equal to 1, the function selection of multi-function terminal shall be set to 43 (PID

parameter switching terminal); When such terminal is invalid, select parameter group 1 (F9-05~F9-07), and when the terminal is valid, select parameter group 2 (F9-15~F9-17).

When F9-18 is equal to 2, if the absolute value of the deviation between setting and feedback is less than the PID parameter switching deviation 1(F9-19), select parameter group 1 for PID parameter. When the absolute value of deviation between given and feedback is greater than PID switching deviation 2(F9-20), select parameter group 2 for PID parameters. When the deviation between given and feedback is between switching deviation 1 and switching deviation 2, the PID parameter is linear interpolation value of two groups of PID parameters, as shown in the figure below.

When F9-18 is equal to 3, the PID parameter has a linear relationship with the current operating frequency, 0Hz corresponds to PID parameter 1, and the maximum output frequency corresponds to PID parameter 2.

| F9-21 | PID initial value | Factory value | Factory value 0.0% Attribute of | | | | |
|-------|--------------------------------|-----------------|---------------------------------|-----------|---|--|--|
| | Setting range | 0.0% ~ 100.0% | | | | | |
| F9-22 | PID initial value holding time | Factory value | 0. 00s | Attribute | 0 | | |
| | Setting range | 0.00s ~ 650.00s | | | | | |

After running the drive, the PID output is fixed as the initial value of PID, and after the initial value of PID is kept for running for PID initial value holding time, the PID enters the regulating operation. The schematic diagram for starting the PID initial value function of the drive is shown in the figure below.

| F9-23 | Positive maximum value of deviation between two outputs | Factory value | 1.00% | Attribute | 0 | |
|-------|--|-----------------|-----------------|-----------|---|--|
| | Setting range | 0.00% ~ 100.00% | | | | |
| F9-24 | Negative maximum value of deviation between two outputs | Factory value | 1.00% | Attribute | 0 | |
| | Setting range | | 0.00% ~ 100.00% | - | | |

This group of parameters is used to limit the difference between the two PID control outputs, so as to achieve the effect of restraining the PID output from changing too fast.

| | PID integr | | Factory value | 00 | Attribute | 0 |
|-------|---------------|----------------------|--|---------------------|-----------|---|
| | | Units | | Integral separation | | |
| 50.25 | 0 | | Invalid | | | |
| | 1 | Valid | | | | |
| F9-25 | Setting range | Setting range Tens 0 | Whether to stop integrating after the output reaches the limit | | | |
| | | | value | | | |
| | | | Continue integration | | | |
| | | 1 | Stop integration | | | |

Units: It controls whether the PID integration is valid. When the multi-function terminal selection integration pause (function 38) is valid, the PID integration will stop running if the units is 1.

Tens:When set to 1, the integral calculation will be stopped after the output of PID operation reaches the maximum or minimum value, which is helpful for less PID overshoot.

| E0.26 | PID feedback loss detection value | Factory value | Attribute | 0 | | |
|-------|-----------------------------------|--|-----------|-----------|---|--|
| F9-26 | Setting range | 0.0%: feedback loss is not judged; 0.1% ~ 100.0% | | | | |
| F9-27 | PID feedback loss detection time | Factory value | 0.0s | Attribute | 0 | |
| | Setting range | 0. 0s ~ 20.0s | | | | |

This function code is used to set whether to detect PID feedback loss.

When the PID feedback quantity is less than the F9-26 feedback loss detection value, and the duration is longer than the F9-27 set time, the drive will report "E.FBL" feedback loss fault.

| | PID stop | operation | Factory value 0 Attribute o | | | |
|-------|---------------|-----------|-----------------------------|---------------------|--|--|
| F9-28 | Setting range | 0 | | | | |
| | | 1 | | Stop with operation | | |

This function code is used to set whether the PID will continue to operate when the machine is stopped. In general, PID stops operation in stop state.

| F9-29 | PID overshoot detection value | Factory value 0.0% Attribute o | | | | |
|-------|-------------------------------|---|------|-----------|---|--|
| | Setting range | 0.0%: feedback overshoot is not judged; 0.1% ~ 100.0% | | | | |
| F9-30 | PID overshoot detection time | Factory value | 0.0s | Attribute | 0 | |
| | Setting range | 0. 0s ~ 20.0s | | | | |

This function code is used to set whether to detect PID feedback overshoot.

When the PID feedback quantity is greater than F9-29 feedback overshoot detection value, and the duration is greater than F9-30 set time, the drive reports "E.FBH" feedback overshoot fault.

| 50.24 | Set length | Factory value | 1000m | Attribute | 0 |
|-------|------------------------|---------------|--------------|-----------|---|
| F9-34 | Setting range | 0m ~ 65535m | | | |
| 50.25 | Actual length | Factory value | 0m | Attribute | 0 |
| F9-35 | Setting range | | 0m ~ 65535m | | |
| 50.20 | Pulse number per meter | Factory value | 100.0 | Attribute | 0 |
| F9-36 | Setting range | | 0.1 ~ 6553.5 | | |

The above function codes are used for fixed-length control.

The length information needs to be acquired through the multi-function digital input terminal, and the actual length F9-35 can be calculated by dividing the number of pulses sampled by the terminal with the number of pulses per meter F9-36. When the actual length is greater than the set length F9-34, the multi-function digital "length reached" ON signal will be output.

In the process of fixed length control, the length can be reset through the multi-function X terminal (the X function is selected as 28). Please refer to $F5-00 \sim F5-04$ for details.

In application, it is necessary to set the corresponding input terminal function as "length count input" (function 27), and HDI port must be used when the pulse frequency is high.

| F9-37 | Set count value | Factory value 1000 Attribute | | | |
|-------|------------------------|------------------------------|------|-----------|---|
| | Setting range | 0 ~ 65535 | | | |
| F9-38 | Designated count value | Factory value | 1000 | Attribute | 0 |
| | Setting range | 0 ~ 65535 | | | |

Count value needs to be acquired through multi-function digital input terminals. In application, it is necessary to set the corresponding input terminal function as "counter input" (function 25), and HDI port must be used when the pulse frequency is high.

When the count value reaches the set count value F9-37, the multi-function digital "set count value reached" ON signal will be output, and then the counter will stop counting.

When the count value reaches the designated count value F9-38, the multi-function digital "designated count value reached" ON signal will be output, and the counter will continue to count until the "set count value".

The specified count value F9-38 shall not be greater than the set count value F9-37. The following figure is a schematic diagram of the functions of set count value reached and designated count value reached.

12.11 FA group multi-segment instruction, simple PLC function

The multi-segment instruction of NVF7 has more functions than the usual multi-speed. In addition to realizing the multi-speed function, it can also be used as the voltage source of VF separation and the set source of process PID. The dimension of multi-segment instruction is relative value.

| FA 00 | Multi-segment instruction 0 | Factory value | 0.0% | Attribute | 0 | |
|-------|-----------------------------|------------------------------|------------------|-----------|---|--|
| FA-00 | Setting range | -100.0% ~ 100.0% | | | | |
| FA 01 | Multi-segment instruction 1 | Factory value | 0.0% | Attribute | 0 | |
| FA-UT | Setting range | -100.0% ~ 100.0% | | | | |
| FA 02 | Multi-segment instruction 2 | Factory value | 0.0% | Attribute | 0 | |
| FA-U2 | Setting range | | -100.0% ~ 100.0% | | | |

| FA-07 | Setting range | | -100.0% ~ 100.0% | | | |
| FA 00 | Multi-segment instruction 8 | Factory value | 0.0% | Attribute | 0 | |
| FA-08 | Setting range | -100.0% ~ 100.0% | | | | |
| FA 00 | Multi-segment instruction 9 | Factory value | 0.0% | Attribute | 0 | |
| FA-09 | Setting range | | -100.0% ~ 100.0% | | | |
| FA 10 | Multi-segment instruction 10 | Factory value | 0.0% | Attribute | 0 | |
| FA-10 | Setting range | -100.0% ~ 100.0% | | | | |
| FA 11 | Multi-segment instruction 11 | Factory value | 0.0% | Attribute | 0 | |
| FA-11 | Setting range | | -100.0% ~ 100.0% | | | |
| FA 10 | Multi-segment instruction 12 | Factory value | 0.0% | Attribute | 0 | |
| FA-12 | Setting range | | -100.0% ~ 100.0% | | | |
| FA 10 | Multi-segment instruction 13 | Factory value | 0.0% | Attribute | 0 | |
| FA-13 | Setting range | | -100.0% ~ 100.0% | | | |
| FA 14 | Multi-segment instruction 14 | Factory value | 0.0% | Attribute | 0 | |
| гА-14 | Setting range | -100.0% ~ 100.0% | | | | |
| EA 1E | Multi-segment instruction 15 | Factory value | 0.0% | Attribute | 0 | |
| FA-15 | Setting range | -100.0% ~ 100.0% | | | | |

Multi-segment instruction can be used in three occasions: as a frequency source, as a voltage source for VF separation, and as a setting source for process PID. In these three applications, the dimension of multisegment instruction is relative value, ranging from -100.0% to 100.0%. When it is used as a frequency source, it is the percentage of relative maximum frequency; When it is used as a voltage source for VF separation, it is the percentage relative to the rated voltage of the motor; However, because the PID setting is a relative value, multi-segment instruction as the PID setting source does not require dimension conversion.

Multi-segment instructions need to be switched and selected according to the different states of the multi-function digital X. For details, please refer to the related instructions in F5 group.

| | Simple PLC r | unning mode | Factory value 0 Attribute | | | |
|-------|---------------|-------------|---|------------------|--|--|
| FA-16 | Setting range | 0 | Sto | nning | | |
| | | 1 | Keep the final value at the end of single running | | | |
| | | 2 | | Keep circulating | | |

The simple PLC function has two functions, as a frequency source or a voltage source for VF separation. The following figure is a schematic diagram when PLC is used as a frequency source. When the simple PLC is used as a frequency source, the multi-segment frequency N is used as a frequency source, and the positive and negative of FA-00~FA-15 determines the running direction. If it is negative, it means that the

drive runs in the reverse direction.

As a frequency source, PLC has three operation modes, which are not available as a voltage source for VF separation. Where:

0: Stop at the end of single running

The drive automatically stops after completing a single cycle, and will be restarted only after waiting for the next startup command.

1: Keep the final value at the end of single running

After completing a cycle, the drive will keep the operating frequency and direction at the final moment. 2: Keep circulating

After completing a cycle, the drive will automatically start the next cycle.

| | Simple PLC power-off me | mory selection | Factory value 00 Attribute | | | |
|-------|-------------------------|----------------------------|----------------------------|----------------|------|--|
| FA-17 | Units | Power-off memory selection | | | | |
| | 0 | No | No power-off memory | | | |
| | 1 | Power-off memory | | | | |
| | Setting range | Tens | Sto | p memory selec | tion | |
| | | 0 | No stop memory | | | |
| | | | | Stop memory | | |

Power-off memory of PLC refers to the memory of the operation stage and operating frequency of PLC before power-off, and the drive will continue to run from the memory stage when it is powered on next time. If no memory is selected, the PLC process will be restarted every time powered on.

The PLC stop memory refers to recording the previous PLC operation stage and operating frequency when it is stopped, and continuing to run from the memory stage when it runs next time. If no memory is selected, the PLC process will be restarted every time it is started.

| | | 5 | PID | | | |
| | | 6 | Preset frequen | cv (F0-08) setting, and | JP/DOWN mo | difiable |

This function code is used to set the set channel of multi-segment instruction 0.

Besides FA-00, there are many other options for multi-segment instruction 0, which is convenient to switch between multi-segment instruction and other set modes. When multi-segment instruction is used as frequency source or simple PLC is used as frequency source, the switching between the two frequency sources can be easily realized.

12.12 FB group communication parameters

| | Communication protocol se | lection | Factory value | 0 | Attribute | 0 | |
|-------|---------------------------|---------|-----------------------|-------|---------------------|-----|--|
| Fb-00 | Fb-00 | | 0 MODBUS-RTU protoco | | | | |
| | Setting range | 1 | Profibus-DP, Profinet | CANop | en, EtherCAT protoc | ols | |

The drive uses serial port to realize MODBUS, Profinet, CANopen and EtherCAT protocols, and only one of these protocols can be used at the same time. Please set this parameter correctly according to actual needs.

| | Communicatio | on baud rate | Factory value | 5005 | Attribute | 0 | | |
|--------|----------------------------|--------------|---------------|------------------|-----------|---|--|--|
| | | Units | | modbus | | | | |
| | | 0 | | 300Bps | | | | |
| | | 1 | | 600Bps | | | | |
| | | 2 | | 1200Bps | | | | |
| | | 3 | | 2400Bps | | | | |
| | | 4 | | 4800Bps | | | | |
| | | 5 | | 9600Bps | | | | |
| | The Office and the Country | 6 | 19200Bps | | | | | |
| Eb. 01 | | 7 | 38400Bps | | | | | |
| FD-01 | setting | 8 | 57600Bps | | | | | |
| | Tange | 9 | | 115200Bps | | | | |
| | | Tens | | Profibus DP, Pro | finet | | | |
| | | 0 | | 115200Bps | | | | |
| | | 1 | | 208300Bps | | | | |
| | | 2 | | 256000Bps | | | | |
| | | 3 | | | | | | |
| | | Hundreds | | Reserved | | | | |
| | | Thousands | | Reserved | | | | |

This parameter is used to set the data transmission rate between the upper computer and the drive. Note that the baud rates set by the upper computer and the drive must be consistent, otherwise communication cannot be carried out. The higher the baud rate, the higher the communication speed.

Units: set modbus communication baud rate as standard for drive; Tens: set the communication baud rate on the expansion board.

| Fb-02 Setting range | MODBUS data format | | Factory value | 0 | Attribute | 0 | | |
|---------------------|--------------------|---|--------------------|------------------|-----------|---|--|--|
| | | 0 | No | No check (8-N-2) | | | | |
| | C. III . | 1 | Even check (8-E-1) | | | | | |
| | Setting range | 2 | Odd check (8-O-1) | | | | | |
| | | 3 | No check (8-N-1) | | | | | |

In MODBUS communication mode, the data formats set by the upper computer and the drive must be consistent, otherwise, communication cannot be carried out.

8-N-2: 8 data bits, no parity bit, 2 stop bits

8-E-1: 8 data bits, even parity bit, 1 stop bit

8-O-1: 8 data bits, odd parity bit, 1 stop bit

8-N-1: 8 data bits, no parity bit, 1 stop bits

| FH 02 | Local address Factory value | Factory value | 1 | Attribute | 0 |
|-------|-----------------------------|---------------|---------|-----------|---|
| FD-03 | Setting range | | 1 ~ 247 | | |

The local address is unique (except the broadcast address), which is the basis for realizing point-to-point communication between the upper computer and the drive. When the address sent by the master is 0, it is a broadcast address, and the slave does not need to return data after receiving the broadcast instruction.

| | MODBUS response delay | Factory value | 2ms | Attribute | 0 |
|-------|-----------------------|---------------|----------|-----------|---|
| FD-04 | Setting range | | 0 ~ 20ms | | |

Response delay: refers to the interval between the end of data reception of the drive and the sending of data to the upper computer. If the response delay is less than the system processing time, the response delay will be subject to the system processing time; If the response delay is longer than the system processing time, the system will wait until the response delay time is up before sending data to the upper computer.

This parameter is the response delay set for MODBUS communication.

| MODBUS communication timeout | Factory value | 0.0s | Attribute | 0 | |
|------------------------------|---------------|------|------------|---|--|
| FD-05 | Setting range | | 0.0 ~ 60.0 | S | |

When the function code is set to 0.0s, the communication timeout parameter is invalid. When this function code is set to a valid value, if the interval between one communication and the next communication exceeds the communication timeout, the system will report a communication failure error (E.CE), which is usually set to be invalid.

| | Data transmission format | | Factory value | 1 | Attribute | 0 |
|-------|--------------------------|-------|------------------------------|---------|-------------|---|
| | | Units | Modbus | | | |
| FD-06 | Setting range | 0 | Non-standard Modbus protocol | | | |
| | | 1 | Standard | l Modbu | ıs protocol | |

Non-standard Modbus protocol and standard Modbus protocol have the following differences when returning communication error codes and read data instructions:

| Re | turn communicat | ion error code | Return read data instruction | | | |
|------|-----------------|------------------------|------------------------------|-----------------------------------|-------------------------|--|
| Byte | Non-standard | Standard | Byte | Non-standard | Standard | |
| 0 | Slave address | Slave address | 0 | Slave address | Slave address | |
| 1 | Function code | 0x80+ function code | 1 | Function code | Function code | |
| 2 | 0x80 | Error code | 2 | Number of data bytes high byte | Number of data bytes | |
| 3 | 0x01 | CRC low byte | 3 | Number of data bytes low byte | Return data N bytes | |
| 4 | 0x00 | CRC high byte | 4 | Return data N bytes | CRC low byte | |
| 5 | Error code | | 5 | CRC low byte | CRC high byte | |
| 6 | CRC low byte | | 6 | CRC high byte | | |
| 7 | CRC high byte | | 7 | | | |

| | Communication current resolution | | Factory value | 0 | Attribute | 0 |
|-------|----------------------------------|---|---------------|------|-----------|---|
| Fb-07 | Catting and a | 0 | 0.01A | | | |
| | Setting range | 1 | | 0.1A | | |

When Modbus communication reads the U0-04 output current, the resolution of the read data can be modified by this parameter. When using the extended communication card to communicate, the read current data is fixed at 0.1A resolution.

| Fb-09 | Interruption detection time for optional card communication | Factory value | 0.0s | Attribute | 0 |
|-------|---|---------------|------|-----------|---|
| | Setting range | 0.0 ~ 60.0s | | | |

When the function code is set to 0.0s, the communication interruption detection parameter is invalid. When this function code is set to a valid value, if the interval between one communication and the next communication exceeds the interruption detection time, the system will report a communication failure error (E.CE), which is usually set to be invalid.

12.13 Fd group optional card

| Fd-00 | Number of encoder lines | Factory value | 1024 | Attribute | 0 |
|-------|-------------------------|---------------|-----------|-----------|---|
| | Setting range | | 1 ~ 65535 | | |

Set the number of pulses per revolution of ABZ or UVW incremental encoder. In the flux vector control mode, the number of encoder pulses must be set correctly, otherwise the motor will run abnormally.

| | Encoder type | | Factory value | 0 | Attribute | 0 |
|-------|----------------|---|---------------|---------|-----------|---|
| Fd-01 | Catting manage | 0 | ABZ inc | rementa | l encoder | |
| | Setting range | 2 | | Resolve | r | |

After the PG card is installed, the encoder type shall be selected correctly according to the actual situation, otherwise the drive may not operate properly.

| | ABZ incremental encoder AB phase sec | uence | Factory value | 0 | Attribute | 0 | |
|-------|--------------------------------------|-------|---------------|--------|-----------|---|--|
| Fd-03 | C-11/1 | 0 | Forward | | | | |
| | Setting range 1 | | | Revers | e | | |

This function code is only valid for ABZ incremental encoder, that is, it is only valid when Fd-01=0. It is used to set the phase sequence of AB signal of ABZ incremental encoder.

This function code is effective for asynchronous motor, and the AB phase sequence of ABZ encoder can be obtained when asynchronous motor is dynamically tuned.

| Fd-07 | Pole pairs of resolver | Factory value | 1 | Attribute | |
|-------|------------------------|---------------|----------|-----------|--|
| | Setting range | | 1 ~ 6553 | 35 | |

The resolver has polar logarithm, and when using this encoder, the parameters of polar logarithm must be set correctly.

| Ed 00 | PG disconnection detection time | Factory value | 0.0s | Attribute | 0 |
|-------|---------------------------------|---------------|------|-----------|---|
| FU-09 | Setting range | 0.0s ~ 10.0s | | | |

It is used to set the detection time of encoder disconnection fault. When it is set to 0.0s, the drive will not detect encoder disconnection fault. When the drive detects the disconnection fault, and the duration exceeds the set time of this parameter, the drive will give the alarm E.ENCD.

12.14 FE group fault and protection

| | Motor overload protection selection | ction | Factory value | 1 | Attribute | 0 | | |
|-------|-------------------------------------|-------|---|---|-----------|---|--|--|
| FE-00 | Setting range 0 | | Prohibit motor | Prohibit motor overload protection function | | | | |
| | | | Enable motor overload protection function | | | | | |
| FF 01 | Motor overload protection gain | | Factory value | 1.00 | Attribute | 0 | | |
| FE-01 | Setting range | | | 0.20 ~ 10.0 | 00 | | | |
| FF 00 | Motor overload warning coefficient | | Factory value 80% Attribute | | | 0 | | |
| FE-02 | Setting range | | | 50% ~ 100 | % | | | |

In order to effectively protect different load motors, it is necessary to set the motor overload protection gain according to the motor overload capacity. Motor overload protection is an inverse time curve, and the motor overload protection curve is shown in the following figure:

As shown in the figure, the motor overload protection time corresponding to the marked running current point and the time between two points are obtained by linear calculation.

Example: At 145% current, the time for reporting OL1 is 6 minutes; At 155% current, the time for reporting OL1 is 4 minutes, then at 150% current, the time for reporting OL1 time is

T = 6 + (4 - 6)*(150% - 145%)/(155% -145%) = 5 (minutes)

Motor overload protection gain:

When the overload protection gain is set to 1.00 by default, when the motor running current reaches 175% of the motor rated current, it will be report motor overload (OL1) after continuous running for 2 minutes; When the running current of the motor reaches 115% of the rated current of the motor, it will report motor overload (OL1) after continuous running for 80 minutes.

If it is necessary to modify the overload time according to the motor, adjust the parameters.

Example: the rated current of the motor is 100A. When FE-01=1.00, when the drive runs to 125A (125%) and lasts for 40 minutes, it will report OL1 fault.

NVF7 Series Drive Operation Instructions

If you want the drive to report OL1 fault after running at 125A for 50 minutes, set FE-01=1.25, 40 * 1.25 =50 minutes.

If you want the drive to report OL1 fault after running at 125A for 20 minutes, set FE-01=0.5, 40 \times 0.5= 20 minutes.

Note: The maximum time for overload is 80 minutes and the minimum time is 10 seconds.

Motor overload warning coefficient:

The motor overload warning function is used to give a warning signal to the control system through DO or relay before motor overload fault protection. This warning coefficient is used to determine how much earlier the warning shall be given before motor overload protection. The larger this value is, the less in advance the warning shall be. When the accumulated output current of the drive is greater than the product of overload time (the value of the inverse time limit curve of motor overload protection) and "motor overload warning coefficient (FE-02)", the multi-function digital DO of the drive outputs a valid signal of "motor overload warning". Under special circumstances, when the motor overload warning coefficient FE-02 is set to 100%, the early amount of warning is 0, and the warning and overload protection occur at the same time.

| FF 02 | Overvoltage stall gain | Factory value | 30 | Attribute | 0 | | |
|-------|----------------------------------|---------------------------|---------------------------|-----------|---|--|--|
| FE-05 | Setting range | 0 ~ 100 | | | | | |
| | Overvoltage stall action voltage | Factory value | Model determination | Attribute | ۲ | | |
| FE-04 | Catting and a | 380V model: 650.0V~800.0V | | | | | |
| - | Setting range | | 220V model: 320.0V~800.0V | / | | | |

Parameter FE-03 has the same function as parameter F4-24, and parameter FE-04 has the same function as parameter F4-22. Please refer to F4 group parameters for details.

| Note: To enable the overvoltage stall function, F4-23 shall be set to 1: Vali | id. |
|---|-----|
|---|-----|

| | Selection of short-circuit ground | protection to | Factory value | 1 | Attribute | 0 | | |
|-------|--------------------------------------|---------------|--|-----------|----------------------|-------|--|--|
| | Units | | Selection of power-on | short-cir | cuit protection to g | round | | |
| FE-07 | - | 0 | Invalid | | | | | |
| | | 1 | Valid | | | | | |
| | Setting range | T | Selection of short-circuit protection to ground before | | | | | |
| | | Teris | operation | | | | | |
| | | 0 | | Invalio | k | | | |
| | | 1 | Valid | | | | | |

Selection of power-on short-circuit protection to ground:

Every time the drive is powered on, the drive detects whether the motor has a short circuit fault to the ground.

Selection of short circuit protection to ground before operation:

Before each operation of the drive, first detect whether the motor has a short circuit fault to the ground, and then start operation properly if there is no such fault.

| | Starting voltage of braking unit action | Factory value | Model determination | Attribute | 0 | | |
|-------|---|---------------------------|------------------------|-----------|---|--|--|
| FE-08 | | 380V model: 650.0V~800.0V | | | | | |
| | Setting range | | 220V model: 320.0V~800 | .0V | | | |

The starting voltage Vbreak of the built-in braking unit is set as follows:

 $(1.414Vs+30) \le Vbreak \le 800$

Vs: AC power supply voltage of input drive

Note: Improper setting of this voltage may lead to abnormal operation of the built-in braking unit!

| FF 00 | Fault automatic reset times | | Factory value | 0 | Attribute | 0 |
|-------|---|-----|---------------|-------------|-----------|---|
| FE-09 | Setting range | | 0 ~ 30 | | | |
| FE-10 | During fault automatic reset Fault DO action selection | | Factory value | 1 | Attribute | 0 |
| | Setting range 0 | | No action | | | |
| | | | Action | | | |
| FF 11 | Automatic reset interval of fa | ult | Factory value | 6.0s | Attribute | 0 |
| FE-11 | Setting range | | | 0.1s ~ 100. | Os | |

Fault automatic reset times:

Set the number of times that can be reset automatically. After this number is exceeded, the drive will no longer automatically reset the fault. Setting it to 0 means that the automatic fault reset function is not enabled. Automatic reset DQ action selection:

If the drive turns on the fault automatic reset function, this parameter can be used to set whether the

fault DO relay acts during the fault reset.

Automatic reset interval:

The waiting time for fault automatic reset after the drive reports a fault.

| | Selection of input open-p connection prot | bhase/contactor ection | Factory value 11 Attribute | | | | | | |
|-------|--|---------------------------|---|----------|---------------|--|--|--|--|
| | | Units | Input open-phase protection selection Input open-phase protection disabled | | | | | | |
| | 0 | | Input open-phas | e protec | tion disabled | | | | |
| FE-12 | | 1 | Simultaneous detection of software and hardware inpu | | | nput | | | |
| | | 1 | open-phase co | ondition | protection | | | | |
| | Setting range | 2 | Software input open-phase protection | | | | | | |
| | | 3 | Hardware input open-phase protection | | | | | | |
| | Tens | | Contactor connection protection selection | | | | | | |
| | | 0 | D | isable | | | | | |
| | | 1 | E | nable | | n disabled ind hardware input otection protection protection on selection | | | |

Input open-phase protection selection:

Hardware input open-phase protection and software input open-phase protection can be selected for input open-phase protection. When software protection is selected, the sensitivity of software input open-phase protection can be adjusted by parameters FE-74 and FE-75.

Contactor connection protection selection:

This function is used to judge whether the starting resistor contactor is connected. If the drive is operated with load while the starting resistor relay is not connected, it will lead to serious heating of the starting resistor or even burning of the starting resistor. It is recommended that this function keep allowing protection options.

| | Output open-phase p selection | rotection | Factory value | 01 | Attribute | 0 | | |
|-------|----------------------------------|-----------|--|----|-----------|---|--|--|
| | | Units | Output open-phase protection selection | | | | | |
| FF-13 | | 0 | Disable | | | | | |
| FE-13 | Catting and a | 1 | Enable | | | | | |
| | Setting range | Tens | Selection of output open-phase protection before operation | | | | | |
| | | 0 | Disable | | | | | |
| | | 1 | Enable | | | | | |

Selection of output open-phase protection:

Select whether to protect the output open-phase. If you select not to protect the output open-phase, the actual drive output current will be distorted and even oscillate.

Selection of output open-phase protection before operation:

If this function is enabled, the drive will send out a DC signal before each operation to detect whether the output is with open-phase.

| FF 14 | Type of the first fault Factory value (| | 0 | Attribute | • | |
|-------|---|---------------|---|-------------------------------------|---|--|
| FE-14 | Setting range | 0 ~ 99 | | | | |

| FF 44 | Running time of drive at the first fault | Factory value | 0 | Attribute | • | | | |
| гс-44 | Setting range | 0.0 | s ~ 65 | 53.5s | | | | |

Input terminal state in case of fault:

Display X state, and convert it into binary correspondence (1 for high level, 0 for low level)

Bit0 - X1; Bit1 - X2; Bit2 - X3; Bit3 - X4; Bit4 - HDI;

Output terminal state in case of fault:

Display DO state, and convert it into binary correspondence (1 for high level, 0 for low level)

Bit0 - HDO; Bit1 - Relay1; Bit2 - Reserved; Bit3 - Relay2; Bit4 - Reserved;

Drive state in case of fault:

Display the operating state information of the drive and convert it into a binary correspondence table

Bit 1: Bit0 – 0: Stop, 1: Forward; 2: Reverse

Bit 3: Bit2 - 0: Constant speed, 1: Acceleration; 2: Deceleration

Bit4 - 0: Bus voltage is normal; 1: Undervoltage

Power-on time of drive in case of fault:

Power-on time of current fault (non-cumulative power-on time)

Running time of drive in case of fault:

Running time of current fault (non-cumulative running time)

The above parameters are used to set the execution mode when the drive has a corresponding fault. When "free stop" is selected, the drive displays E.xxx and stops directly.

When "stop by stopping mode" is selected, the drive displays A.xxx, and stops by stopping mode, and displays E.xxx after stopping.

When "continue running" is selected, the drive continues to run and display A.xxx, and the operating frequency is set by FE-54.

| | Selection of contin | Selection of continuous operating frequency in case of fault | | 0 | Attribute | 0 | |
|-------|---------------------|--|--|-------------------------------------|-----------|----|--|
| | | 0 | Run at the current operating frequency | | | | |
| FF F4 | | 1 | Run at the set frequency | | | | |
| FE-04 | Setting range | Setting range 2 | | Run at the upper limiting frequency | | | |
| | | 3 | Run at the lower limiting frequency | | | | |
| | | 4 | Run at abnormal standby frequency | | | | |
| | Abi | Factory value | 100.0% | Attribute | 0 | | |
| FE-55 | | Setting range | 0.0% ~ 100.0% (100.0% for the maximum frequency | | | y) | |

When a fault occurs during running of the drive, and the handling mode of the fault is set to continue to run, the drive displays A.xxx and runs at the frequency determined by FE-54.

When the abnormal standby frequency is selected for running, the value set by FE-55 is the percentage relative to the maximum frequency.

| | Motor temperature sensor type | | Factory value | 0 | Attribute | 0 | |
|-------|----------------------------------|---------------|-----------------------|---------------------------|-----------|---|--|
| | | 0 | No temperature sensor | | | | |
| FE-56 | Setting range | 1 | | PT100 | | | |
| | Γ | 2 | PT1000 | | | | |
| FF F7 | Motor overheat protection thresh | hold | Factory value | ory value 110°C Attribute | | | |
| FE-57 | Setting range | Setting range | | 0°C ~ 200°C | 2 | | |
| FF F0 | Motor overheat pre-alarm thresh | nold | Factory value | 90°C | Attribute | 0 | |
| FE-58 | Setting range | | 0°C ~ 200°C | | | | |

If it is necessary to monitor the motor temperature, it is necessary to connect the temperature sensor to the analog input AI3 of the drive optional card. At present, PT100 and PT1000 temperature sensors are supported, and FE-56 is set according to the type of connected sensor. The real-time temperature value of the motor can be viewed in U0-34.

When the motor temperature exceeds the motor overheat protection threshold FE-57, the drive reports E.OH2 fault.

When the motor temperature exceeds the motor overheat pre-alarm threshold FE-58, the drive multifunction digital DO or relay outputs the motor overheat pre-alarm ON signal (DO or relay terminal function is set to 39: Motor overheat alarm).

| | Selection of instantaneous stop failure f | unction | Factory value 0 Attribute | | | 0 | | |

| FE-03 | Setting range | | | 0~100 | | | | |
| | Instantaneous stop integration Ki | | Factory value | 30 | Attribute | 0 | | |
| FE-04 | Setting range | | | 0~100 | | | | |
| EE GE | Deceleration time of instantaneous stop | failure | Factory value | 20.0s | Attribute | ۲ | | |
| FE-65 | Setting range | | C | .0s ~ 300 | .0s | | | |

When the bus voltage drops below the "judgment voltage of instantaneous stop failure action", the instantaneous stop failure process takes effect, and the output frequency of the drive automatically drops, so that the motor is in the power generation state. The instantaneous stop failure function can feed back the electric energy to the bus, keep the bus voltage around the "judgment voltage of instantaneous stop failure action" and decelerate the system to 0Hz properly. As shown in the figure below:

The purpose of instantaneous stop failure is to ensure that the motor can stop by deceleration properly when the power supply of the power grid is abnormal, so that the motor can be started immediately after the power supply of the power grid is restored, and it will not stop freely because of the sudden undervoltage fault of the motor when the power supply of the power grid is abnormal (in a large inertia system, it takes a long time for the motor to stop freely, and when the power supply of the power grid is restored, as the motor is still rotating at high speed, it is easy to cause overload or overcurrent fault of the drive when the motor is started).

Bus voltage constant control:

In case of instantaneous stop failure action, the drive will adjust the output frequency through the PI loop to keep the bus voltage at the "judgment voltage of instantaneous stop failure action". When the power supply of the power grid is restored, the output frequency of the drive continues to run to the target frequency.

Stop by deceleration control:

In case of instantaneous stop failure action, the drive will adjust the output frequency through the PI loop to keep the bus voltage at the "judgment voltage of instantaneous stop failure action". When the power supply of the power grid is restored, the drive will continue to decelerate to 0Hz and stop until the drive sends out the start command again.

| FE-66 | Unloading protection selection | | Factory value | 0 | Attribute | 0 | | |
|-------|--------------------------------|---------------|---------------|--------------|-----------|---|--|--|
| | C. III . | 0 | | Invalid | | | | |
| | Setting range 1 | | Valid | | | | | |
| | Unloading detection level | Factory value | 10.0% | Attribute | 0 | | | |
| FE-67 | Setting range | | 0.0% ~ 100.0 | % | | | | |
| FE-68 | Unloading detection time | | Factory value | 1.0s | Attribute | 0 | | |
| | Setting range | | | 0.0s ~ 60.0s | | | | |

If the unloading protection function is valid, then, if the output current of the drive is less than the unloading detection level FE-67 for a duration longer than the unloading detection time FE-68, when selecting to continue running during unloading (FE-49=02000), it will directly jump to 7% of the rated frequency of the motor to continue running. During unloading protection, if the load is restored, the drive will automatically restore to the set frequency operation.

| FE-70 | Overspeed detection value | Factory value | 20.0% | Attribute | 0 | |
|-------|---------------------------|----------------------------------|-------|-----------|---|--|
| | Setting range | 0.0% ~ 50.0% (maximum frequency) | | | | |
| FE-71 | Overspeed detection time | Factory value | 1.0s | Attribute | 0 | |
| | Setting range | 0.0s ~ 60.0s | | | | |

This function is only effective when the drive has flux vector control. When the drive detects that the actual speed of the motor exceeds the maximum frequency, and the excess value is greater than the overspeed detection value FE-70, for a duration longer than the overspeed detection time FE-71, the drive reports the fault E.OS and handles it according to the fault protection action mode.

When the overspeed detection time is 0.0s, the overspeed fault detection is disabled.

| FE-72 | Detection value of excessive speed deviation | Factory value | 20.0% | Attribute | 0 | |
|-------|--|----------------------------------|-------|-----------|---|--|
| | Setting range | 0.0% ~ 50.0% (maximum frequency) | | | | |
| FE-73 | Detection time of excessive speed deviation | Factory value | 5.0s | Attribute | 0 | |
| | Setting range | 0.0s ~ 60.0s | | | | |

This function is only effective when the drive has flux vector control. When the drive detects that the actual speed of the motor deviates from the set frequency, and the deviation value is greater than the detection value FE-72 of excessive speed deviation for a duration longer than the detection time FE-73 of excessive speed deviation, the drive reports the fault E.DEV and handles it according to the fault protection action mode.

When the detection time of excessive speed deviation is 0.0s, the fault detection of excessive speed deviation is cancelled.

| FE-74 | Software input open-phase sensitivity | Factory value | 5% | Attribute | 0 | |
|-------|---------------------------------------|---------------|--------|-----------|---|--|
| | Setting range | 1% ~ 50% | | | | |
| FE-75 | Software input open-phase filtering | Factory value | 20 | Attribute | 0 | |
| | Setting range | | 1 ~ 50 | | | |

When FE-12 input open-phase detection enables software input open-phase detection, the sensitivity of software input open-phase detection can be adjusted by modifying this parameter.

Input open-phase sensitivity:

The percentage setting of sensitivity is based on the rated bus voltage of the drive. Only when the fluctuation of bus voltage is greater than this set value will the software input open-phase fault be reported. Example: If the rated bus voltage is 540V, the 5% fluctuating voltage is 27 V.

Input open-phase filtering:

The filter parameters are used to eliminate the interference of software detection. The larger the parameter setting, the better the anti-interference performance, but the worse the sensitivity of software input open-phase detection; The smaller the parameter setting, the worse the anti-interference performance, but the higher the sensitivity of software input open-phase detection. Please set this parameter according to actual needs.

12.15 FF group user-defined function code

| FF-00 ~ FF-29 | User function code | Factory value | | Attribute | 0 | |
|---------------------|--------------------|---------------|--|-----------|---|--|
| | | F0-00~FE-xx | | | | |
| | Setting range | A0-00~A5-xx | | | | |
| | | U0-00~U0-xx | | | | |

This group of function codes is a user-defined parameter set. Users can select the required parameters from all function codes and summarize them into FF group as user-defined parameters. When switching to the user-defined parameter display mode through the QUICK key, you can quickly check the parameters set by the user.

FF group can provide up to 30 user-defined parameters, and the display value of FF group parameters is F0.00, which means that the user function code is empty. When entering the user-defined parameter mode, the displayed function codes are defined by FF-00 ~ FF-31, with the same sequence as the FE group function codes; if it is F0-00, skip.

| A0-00 | Minimum input of Al curve 4 | Factory value | 0.00V | Attribute | 0 | |
|-------|--|------------------|------------|-----------|---|--|
| | Setting range | -10.00V ~ A0-02 | | | | |
| A0-01 | Minimum input corresponding setting of AI curve 4 | Factory value | 0.0% | Attribute | 0 | |

| | Setting range | -100.0% ~ 100.0% | | | | |

12.16 A0 group terminal expansion function

Al curve 4 can flexibly set a given setting corresponding to multipoint input voltage, as shown in the following figure:

| 40.24 | Al1 set jump point | Factory value 0.0% Attribute | | | 0 | |
|-------|------------------------|------------------------------|--------------|-----------|---|--|
| AU-24 | Setting range | -1 | 00.0% ~ 100 | .0% | | |
| A0.25 | Al1 set jump amplitude | Factory value | 0.1% | Attribute | 0 | |
| AU-25 | Setting range | | 0.0% ~ 100.0 | % | | |
| 40.26 | AI2 set jump point | Factory value | 0.0% | Attribute | 0 | |
| AU-20 | Setting range | -100.0% ~ 100.0% | | | | |
| 40.27 | Al2 set jump amplitude | Factory value | 0.1% | Attribute | 0 | |
| AU-27 | Setting range | 0.0% ~ 100.0% | | | | |
| 10.20 | AI3 set jump point | Factory value | 0.0% | Attribute | 0 | |
| AU-20 | Setting range | -100.0% ~ 100.0% | | | | |
| 40.20 | AI3 set jump amplitude | Factory value | 0.1% | Attribute | 0 | |
| A0-29 | Setting range | | 0.0% ~ 100.0 | % | | |

Please refer to AI4 for curve setting of AI5.

Analog inputs Al1~Al3, all with the setting value jump function. The jump function refers to fixing the analog corresponding set value as the value of jump point when the analog corresponding set value changes within the interval of jump point.

Example: The voltage of analog input AI fluctuates around 5.00V, ranging from 4.90 V to 5.10 V, with the minimum input of 0.00V corresponding to 0.0% and the maximum input of 10.00V corresponding to 100.0% for Al1, so the detected Al1 corresponding setting fluctuates between 49.0% and 51.0%.

If the jump point A0-24 of Al1 is set to 50.0% and the jump amplitude A0-25 of Al1 is set to 1.0%, the corresponding setting of Al1 input is fixed as 50.0% after the jump function processing, and Al1 is transformed into a stable input.

| 40.20 | Virtual VDI1 terminal function | Factory value | 0 | Attribute | 0 | |
|---|--------------------------------|---------------|------|-----------|---|--|
| AU-30 Setting range | | 0 ~ 59 | | | | |

| 40.24 | Virtual VDI5 terminal function | Factory value | 0 | Attribute | 0 | |
| AU-34 | Setting range | | 0~59 |) | | |

Virtual VDI1~VDI5 are exactly the same as DI on the control panel in function, and can be used as multi -function digital input. Please refer to the digital multi-function input DI function for details.

| | VDI valid state setting | | Factory value | Factory value 0 Attribute @ | | | | | |
|-------|-------------------------|------------------|---|---|-----------|---|--|--|--|
| | | Units | VDI1 | | | | | | |
| | | 0 | Whether VDI is valid or not is determined by the state of virtual | | | | | | |
| 40.25 | C III | 1 | Whether VDI | Whether VDI is valid or not is set by parameter A0-36 | | | | | |
| AU-35 | Setting | Tens | | VDI2 | | | | | |
| | range | Hundreds | | VDI3 | | | | | |
| | | Thousands | VDI4 | | | | | | |
| | | Ten thousands | VDI5 | | | | | | |
| | VDI termir | al state setting | Factory value | 0 | Attribute | 0 | | | |
| | | Units | VDI1 | | | | | | |
| | | 0 | | Invalid | | | | | |
| 40.20 | Catting | 1 | Valid | | | | | | |
| AU-36 | Setting | Tens | | VDI2 | | | | | |
| | range | Hundreds | VDI3 | | | | | | |
| | | Thousands | | VDI4 | | | | | |
| | | Ten thousands | | VDI5 | | | | | |

The state of virtual VDI can be set in two ways, which can be selected through A0-35.

The VDI state is determined by the state of the corresponding virtual VDO:

The VDIx state is bound to the VDOx state. When VDOx acts, the corresponding VDIx is valid; When VDOx does not act, the corresponding VDIx is invalid.

For example, to set the output current of the drive as 120% of the rated current of the motor, the drive will stop and report the fault, and set as follows

F8-38 = 120%; F8-39 = 5%; Any reached current and detection amplitude.

A0-30 = 44 user-defined fault 1.

A0-41 = 28 virtual VDO1 output function selection <current reached 1>.

In this case, run the drive, and when the output current reaches any current reached detection condition, the drive will stop and report E.US1 user fault 1.

Set VDI state by parameter A0-36:

Parameters can be modified manually or by communication to change the state of VDI terminal.

For example, when A0-30 = 1 for forward running, and A0-31 = 2 for reverse running. At this time, A0-36 units and tens of data can be modified manually or by communication to control the forward and reverse running of the drive.

| 40.27 | Function selection when | Factory value | 0 | Attribute | 8 | |
|-------|----------------------------|----------------------|------------------|-----------|-----------|---|
| AU-37 | Setting ra | nge | 0 ~ 63 | | | |
| 40.20 | Function selection when | AI2 is used as DI | Factory value | 0 | Attribute | 0 |
| A0-38 | Setting ra | nge | | 0~6 | 3 | |
| 40.20 | Function selection when | Factory value | 0 | Attribute | 0 | |
| AU-39 | Setting ra | nge | | 0 ~ 5 | 9 | |
| | Effective mode selection w | hen AI is used as DI | Factory value | 0 | Attribute | 0 |
| | | Units | | AI1 | | |
| 40.40 | | 0 | High level valid | | | |
| A0-40 | Setting range 1 | | Low level valid | | | |
| | | Tens | AI2 | | | |
| | | AI3 | | | | |

This group of function codes is used to use AI as DI. When AI is used as DI, the AI terminal state is high level when the AI input voltage is greater than 7V, and low level when the AI input voltage is less than 3V. Keep the state unchanged between 3V and 7V.

A0-40 is used to determine whether the high level of AI is valid or the low level is valid when AI is used as DI.

| VDO1 output fund | | unction selection | Factory value 0 Attribu | | Attribute | 0 |
|------------------|------------------------|-------------------|--|------|-----------|---|
| A0-41 | Catting you as | 0 | Short circuit with physical DIx inside | | | |

| AO 51 | | 1 | Negative logic | | | |
| AU-51 | Setting range | Tens | VDO2 | | | |
| | | Hundreds | VDO3 | | | |
| | | Thousands | VDO4 | | | |
| | | Ten thousands | VDO5 | | | |

This group of parameters is used to set the function of the virtual VDO output. There are two ways to select the function of VDOx:

Short circuit with physical DIx inside:

The state at this time is determined by the external terminal DIx of the drive. When the DIx input is valid, VDOx output is in valid state; When DIx input is invalid, VDOx output is in invalid state.

Same as DO output function:

For VDO function, please refer to F6 multi-function digital output DO function.

At the same time, positive logic or negative logic can be selected for the output valid state of VDOx.

12.17 A5 group second motor parameters

The definition and usage of all parameters of A5 group function code corresponding motor 2 and A5 group are the same as those of the first motor. Please refer to the details of related parameters and functions of the first motor F2 and F3 groups.

12.18 U0 group monitoring parameter

U0 parameter group is used to monitor the operation state information of drive, which can be viewed by customers through the panel to facilitate on-site debugging. This group of parameters is read-only and cannot be modified.

| Parameter number | Function | Parameter range | Notes |
|---------------------|------------------------|--|---|
| U0-00 | Operating frequency | 0.00 ~ 500.00Hz | Display the current operating frequency of the drive |
| U0-01 | Set frequency | 0.00 ~ 500.00Hz | Display the target frequency of the drive |
| U0-02 | Bus voltage | 0.0V ~ 3000.0V | Display the voltage value of the drive bus |
| U0-03 | Output voltage | 0V ~ 1140V | Display the output voltage value of the drive during running |
| U0-04 | Output current | 0.00A ~ 655.35A (drive power ≤ 55kW) 0.0A ~ 6553.5A (drive power >55kW) | Display the output current value of the drive during running |
| U0-05 | Output power | 0.0KW ~ 6553.5KW | Display the output power (active power) of the drive during running |
| U0-06 | Output torque | -200.0% ~ 200.0% | Display the percentage output value of motor rated torque |
| U0-07 | X input state | 0 ~ 32767 | Display DI state, and convert it into binary correspondence (1 for high level, 0 for low level) Bit0 – X1; Bit1 – X2; Bit2 – X3; Bit3 – X4; Bit4 – HDI; |
| U0-08 | DO output state | 0 ~ 32767 | Display DO state, and convert it into binary correspondence (1 for high level, 0 for low level) Bit0 – HDO; Bit1 – Relay1; Bit2 – Reserved; Bit3 – Relay2; Bit4 – Reserved; |

| Parameter | Function | Parameter | Notes |
|-----------|----------------------------------|------------------------|--|
| number | | range | |
| U0-09 | Al1 voltage | 0.00V ~ 11.00V | Corrected voltage |
| U0-10 | Al2 voltage | 0.00V ~ 11.00V | Corrected voltage |
| U0-11 | AI3 voltage | 0.00V ~ 11.00V | Corrected voltage |
| U0-12 | Count value | 0 ~ 65535 | Display the pulse signal count value when X is set to <counter input=""> function</counter> |
| U0-13 | Length value | 0 ~ 65535m | Display the record length value when X is set to |
| U0-14 | Load speed | 0 ~ 65535 | When stop: set frequency * coefficient (F7-07); When running: operating frequency * coefficient (F7-07) |
| U0-15 | PID setting | 0 ~ 65535 | Set value (percentage) * Range (F9-04) |
| U0-16 | PID feedback | 0 ~ 65535 | Eeedback value (percentage) * Range (E9-04) |
| U0-17 | PLC stage | 0~15 | Current stage of PLC function operation |
| U0-18 | Input frequency of pulse | 0.00kH~100.00KHz | Display the high-speed pulse frequency input by HDI terminal |
| U0-19 | Feedback speed | -320.00~320.00Hz | Actual operating frequency of the motor, VF is the output frequency of the drive, and the decimal point is set by F7-08 |
| U0-20 | Remaining running time | 0.0 ~ 6500.0min | When the timing function is turned on (F8-42), the remaining running time of the drive is displayed |
| U0-21 | Al1 voltage before correction | 0.00V ~ 11.0V | Voltage before correction |
| U0-22 | AI2 voltage before correction | 0.00V ~ 11.0V | Voltage before correction |
| U0-23 | AI3 voltage before correction | 0.00V ~ 11.0V | Voltage before correction |
| U0-24 | Motor speed | 0 ~ 65535m/min | Display the linear speed of HDI sampling, and calculate the linear speed value according to the actual number of pulses sampled per minute and F9-36 (number of pulses per meter) |
| U0-25 | Current power-on time | 0 ~ 65535min | Power-off clearing |
| U0-26 | Current running time | 0 ~ 65535min | Stop clearing |
| U0-27 | Input frequency of pulse | 0 ~ 65535Hz | Same as U0-18, in Hz |
| U0-28 | Communication set value | -100.00%~100.00% | Set frequency, set torque, etc. in communication setting |
| U0-29 | Encoder feedback speed | -320.00Hz~320.0 0Hz | Motor operating frequency measured by the encoder, to display decimal point set by F7-08 |
| U0-30 | Main frequency display | 0.00 ~ 500.00Hz | Display the main frequency setting |
| U0-31 | Auxiliary frequency display | 0.00 ~ 500.00Hz | Auxiliary frequency display |
| U0-32 | Reserved | | |
| U0-33 | Reserved | | |
| U0-34 | Motor temperature value | 0°C~200°C | When AI3 is connected to the motor temperature sensor, display the motor temperature |
| U0-35 | Target torque | -200.0%~200.0% | Display the current torque target set value |

| Parameter number | Function | Parameter range | Notes |
|---------------------|--|--------------------|---|
| U0-36 | Resolver position | 0 ~ 4096 | Display the current position signal of resolver |
| U0-37 | Power factor angle | -180°~180° | Display the power factor angle of the output power |
| U0-38 | ABZ position | 0 ~ 65535 | Display the AB phase pulse count of the current ABZ or UVW encoder, which is the number of pulses after 4 times frequency multiplication. This value automatically increases when the encoder runs forward, and decreases when the encoder runs reverse. It restarts counting from 0 when it increases to 65535, or from 65535 when it decreases to 0 |
| 110-39 | V/F separation | 0V~Rated | Display the target output voltage when running in VF |
| | target voltage | voltage of motor | separation state |
| U0-40 | V/F separation | 0V~Rated | Display the current actual output voltage when running |
| | output voltage | voltage of motor | in VF separation state |
| U0-41 | Visual display of X input state | | AI2 VDI5 VDI3 VDI1 HDI DI3 DI1 AI3 AI1 VDI4 VDI2 DI4 DI2 Digital tube segment code on for high level and off for low level |
| U0-42 | Visual display of DO output state | | vdo4 vdo2 HDO I I I I vdo5 vdo3 relay2 vdo1 vdo1 Digital tube segment code on for high level and off for low level |
| U0-43 | Visual display 1 of X function state | | $\begin{array}{c ccccccccccccccccccccccccccccccccccc$ |
| U0-44 | Visual display 2 of X function state | | $\begin{array}{c ccccccccccccccccccccccccccccccccccc$ |

12.19 MODBUS communication

1)Networking mode

The drive provides RS485 communication interface and adopts international standard Modbus communication protocol for master-slave communication. Users can realize centralized control through PC/ PLC, upper computer monitoring software, etc. (setting the control command and operating frequency of the drive, modifying the parameters of relevant function codes, monitoring the working state and fault information of the drive, etc.) to meet specific application requirements.

There are two networking modes of the drive (as a slave station): single master/multi-slave mode and single master/single slave mode, as shown in the following figure:

Modbus communication related parameters can be described with reference to Fb group function code, and the default communication parameters are as follows:

Address of slave station:0x01

Baud rate:9600bps

Data format:8-N-2 (8 data bits, no parity bit, 2 stop bits)

2) Wiring instructions

2.1) Topological structure

No repeater RS-485-Modbus is configured, and there is a trunk cable directly connected to all equipment or connected through short branch cables.

Trunk cable, also known as bus, can be very long. Its two ends must be connected to line terminals. Repeaters can be also used between multiple RS-485 Modbus. And the address of each slave address in the network is unique, which is the basis of ensuring Modbus serial communication.

2.2) Length

The end-to-end length of trunk cables must be limited. The maximum length is related to baud rate, cable (specification, capacitance or characteristic impedance), number of loads on chain and network configuration (2-wire or 4-wire system).

For cables with high-speed baud rate of 9600bps and AWG26 (or thicker), the maximum length is 1000m. The branch must be short and cannot exceed 20m. If a multiport splitter with n branches is used, the maximum length of each branch must be limited to 40m divided by n.

2.3) Grounding form

The "common terminal" circuit (the common terminal of signal and optional power supply) must be directly connected to the protective ground, and it is better to ground the whole bus at a single point. Usually, this point can be selected on the master station or its splitter.

2.4) Cable

Modbus cable on serial link must be shielded. At one end of each cable, its shield must be connected to the protective ground. If a connector is used at this end, connect the connector housing to the cable shielding. RS485-Modbus must adopt a balanced pair and a third wire (for the common terminal).

For RS485-Modbus, the cable diameter must be wide enough to allow the maximum length (1000m).

AWG24 can meet the needs of Modbus data transmission.

- 3) Communication mode
- 1) The communication protocol of the drive is Modbus protocol, which supports RTU protocol.
- 2) The drive is a slave, and the master-slave point-to-point communication. When the master sends a command using the broadcast address, the slave does not answer.
- 3) In the case of multi-machine communication or long-distance communication, connecting (100~120) ohm resistors in parallel at the positive terminal and negative terminal of the signal line of the master station communication can improve the immunity of communication.
- 4) The drive provides an RS485 interface. If the communication port of the external device is RS232, an additional RS232/RS485 conversion device is required.

5) Protocol format

Modbus protocol supports RTU mode, and the corresponding frame format is shown in the following figure

In RTU mode, the idle time between frames is the greater of the function code setting and Modbus internal agreed value. The minimum inter-frame idle agreed in Modbus is as follows: The frame header and the frame footer are defined by the bus idle time of no less than 3.5 bytes. There shall be at least 3.5 characters of bus idle between frames, and it is not required to accumulate the start and end idle for the bus idle between frames.

Address of slave station:Setting range of drive slave station address 1 ~ 247. When the address sent by the master station is 0, it is a broadcast address, and the slave station does not need to be recovered. Broadcast commands can only be used for write commands.

Function code:At present, there are three Modbus function codes supported by the drive

| Function code | Notes | |
|---------------|--------------------------------------|--|
| 0x03 | Read register instruction | |
| 0x06 | Write single register instruction | |
| 0x10 | Write multiple register instructions | |

Data:The Modbus register is 2 bytes long, so the data written into the register by the drive is usually 2 bytes, and the data read from the drive is also 2 bytes. The drive can read or write up to 12 register data at a time.

Check code:CRC-16 is used for data check, with the whole frame information adopted for check, and the low byte check data sent before the high byte.

Communication example:

Communication 0x03 function code reads F0-08 data

| Master station \rightarrow Drive | | Master station ← Drive | |
|------------------------------------|------|------------------------|------|
| Slave station address | 0x01 | Slave station address | 0x01 |
| Function code | 0x03 | Function code | 0x03 |
| Register high byte | 0x00 | Number of registers | 0x02 |
| Register low byte | 0x08 | Data high byte | 0x13 |
| Number of registers high byte | 0x00 | Data low byte | 0x88 |
| Number of registers low byte | 0x01 | CRC low byte | 0xB5 |
| CRC low byte | 0x05 | CRC high byte | 0x12 |
| CRC high byte | 0xC8 | | |

| Master station → Drive | | Master station ← Drive | |
|------------------------|------|------------------------|------|
| Slave station address | 0x01 | Slave station address | 0x01 |
| Function code | 0x06 | Function code | 0x06 |
| Register high byte | 0x00 | Register high byte | 0x00 |
| Register low byte | 0x08 | Register low byte | 0x08 |
| Data high byte | 0x0F | Data high byte | 0x0F |
| Data low byte | 0xA0 | Data low byte | 0xA0 |
| CRC low byte | 0x0D | CRC low byte | 0x0D |
| CRC high byte | 0x80 | CRC high byte | 0x80 |
| | | | |

Communication 0x06 function code changes F0-08 parameter to 40.00Hz

Communication 0x10 function code changes F0-17 and F0-18 parameters to 10.0s

| Master station → Drive | | Master station ← Drive | |
|-------------------------------|------|-------------------------------|------|
| Slave station address | 0x01 | Slave station address | 0x01 |
| Function code | 0x10 | Function code | 0x10 |
| Start register high byte | 0x00 | Start register high byte | 0x00 |
| Start register low byte | 0x11 | Start register low byte | 0x11 |
| Number of registers high byte | 0x00 | Number of registers high byte | 0x00 |
| Number of registers low byte | 0x02 | Number of registers low byte | 0x02 |
| Number of register bytes | 0x04 | CRC low byte | 0x11 |
| Data 1 high byte | 0x00 | CRC high byte | 0xCD |
| Data 1 low byte | 0x64 | | |
| Data 2 high byte | 0x00 | | |
| Data 2 low byte | 0x64 | | |
| CRC low byte | 0x73 | | |
| CRC high byte | 0x5B | | |

Data returned by communication fault frame:

| Fault frame (master station ← drive) | | | |
|--|--|--|--|
| Slave station address | | | |
| 0x80 + Function code | | | |
| Fault codes (defined in the following table) | | | |
| CRC low byte | | | |
| CRC high byte | | | |

Definition of communication fault code:

| Ser.No. | Communication fault code | Fault description |
|---------|--------------------------|--|
| 1 | 0x01 | Illegal command |
| 2 | 0x02 | Illegal address |
| 3 | 0x03 | Illegal data |
| 4 | 0x04 | Other errors (CRC error, parameter read-only, parameter locking, etc.) |

a)Function code parameter address rule

Address representation rules with function code group number and label as parameters:

High byte: 0x00~0x0F (F0~FF group), 0x40~0x45 (A0~A5 group) and 0x70 (U0 group)

Low byte: 0x00~0xFF

For example, to access the function code F0-08, the access address of the function code is expressed as 0x0008;

Note:

U group: read-only and non-modifiable.

Some parameters cannot be changed when the drive is in operation; Some parameters cannot be changed regardless of the state of the drive; When changing the parameters of the function code, attention shall be also paid to the range, unit and related description of the parameters.

| Function code group number | Communication access address | Communication modifies the function code address in RAM |
|-------------------------------|---------------------------------|--|
| F0~ FF group | 0x0000 ~ 0x0FFF | 0x8000 ~ 0x8FFF |
| A0~ A5 group | 0x4000 ~ 0x45FF | 0xC000 ~ 0xC5FF |
| U0 group | 0x7000 ~ 0x70FF | |

As EEPROM is frequently stored, it will reduce the service life of EEPROM, therefore, some function codes do not need to be stored in communication mode, just change their values in RAM. When data only needs to be saved in RAM (that is, data is not saved after power-off), the highest address position is set to "1".

Example:

The function code F0-08 is not stored in EEPROM, and the address is expressed as 8008;

This address means that you can only write RAM, but not read. When reading, it is an invalid address. Communication settings: (write only)

| Communication setting address | Set value | Parameter description | |
|-------------------------------|----------------|--|--|
| 3201H | -10000 ~ 10000 | 10000 for 100.00%, -10000 for -100.00% | |

The communication set value is a percentage of the relative value, with 10000 for 100.00% and -10000 for -100.00%. For data of frequency dimension, this percentage is the percentage of the relative maximum frequency (F0-10); For torque dimension data, the percentage is F3-11.

Note: The "communication setting" options in the parameters all set data through this address. Control command: (write only)

| Command | Address | Command function |
|------------------------|---------|-----------------------------|
| | | 0000: No command |
| | | 0001: Forward running |
| | | 0002: Reverse running |
| | | 0003: Stop by deceleration |
| Control command | 3200H | 0004: Forward jog |
| | | 0005: Reverse jog |
| | | 0006: Reserved |
| | | 0007: Free stop |
| | | 0008: Fault reset |
| | 220211 | BIT0: DO1 output control |
| | | BIT1: DO2 output control |
| | | BIT2: RELAY1 output control |
| | | BIT3: RELAY2 output control |
| Digital autout control | | BIT4: HDO output control |
| Digital output control | 52021 | BIT5: VDO1 |
| | | BIT6: VDO2 |
| | | BIT7: VDO3 |
| | | BIT8: VDO4 |
| | | BIT9: VDO5 |

F0-28 parameter initialized communication:

In order to prevent mis-operation, it is necessary to communicate on the user password F7-00 before modifying F0-28, and write data into F7-00 before operating F0-28. Even if the user password is not set, be sure to write 0 to F7-00. For example, a parameter needs to be reset

Send data:01 06 07 00 00 00 88 BE Return data:01 06 07 00 88 88 EE D8 Re-write

Send data:01 06 00 1C 00 02 C9 CD

Return data:01 06 00 1C 00 02 C9 CD

User-defined parameter group FF group communication:

1. When communication needs to modify the parameter address mapped by the user-defined parameter group FF.XX, and the register address of the operation is 0x2FXX, for example, if is required to modify the parameter F0.08 mapped by FF.00, the following instruction is sent:

Send data:01 06 2F 00 F0 08 C4 D8

Return data:01 06 2F 00 F0 08 C4 D8

Different parameter groups map different data, as shown in the following table:

| Parameter set | Mapping communication data |
|---------------|----------------------------|
| F0~FE group | 0xF0XX |
| A0 group | 0xA0XX |
| U group | 0x70XX |

2. When the register address of communication operation is FF.XX, the parameters mapped in FF group are used for communication operation. For example, F0.08 is set in FF.00, and F0.08 parameter is modified when the 0F.00 address is written by 06 function code

Send data: 01 06 0F 00 03 E8 8A 60

Return data: 01 06 0F 00 03 E8 8A 60

At this time, F0.08 preset frequency is modified by 10.00Hz.

Parameter Summary

" \circ ": It indicates that the set value of this parameter can be changed when the drive is in stop or running state;

- "
 "
 ": It indicates that the set value of this parameter cannot be changed when the VFD is running;
- "•": It indicates that the value of this parameter is the actual testing record value and cannot be changed;

| Param eters | Name | Setting range | Factory value | Change |
|----------------|---|--|------------------|--------|
